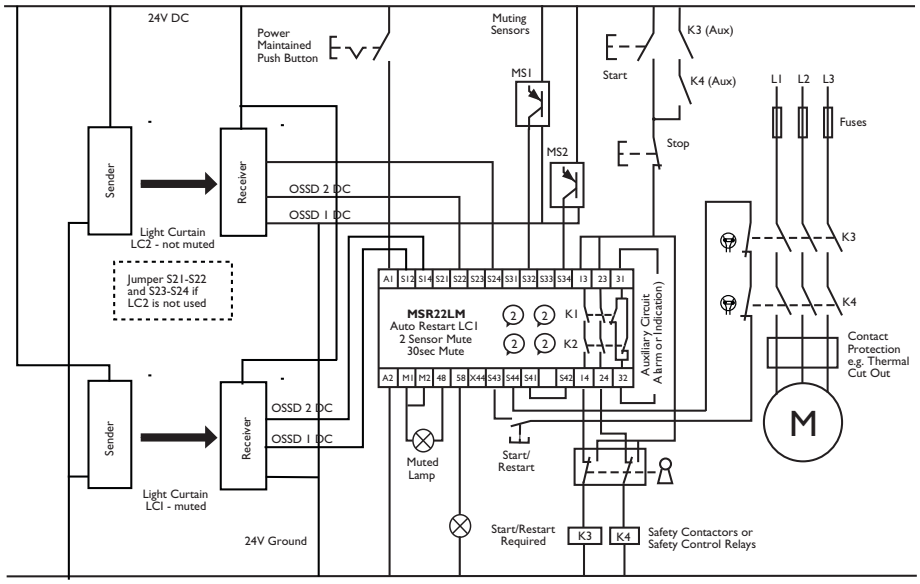
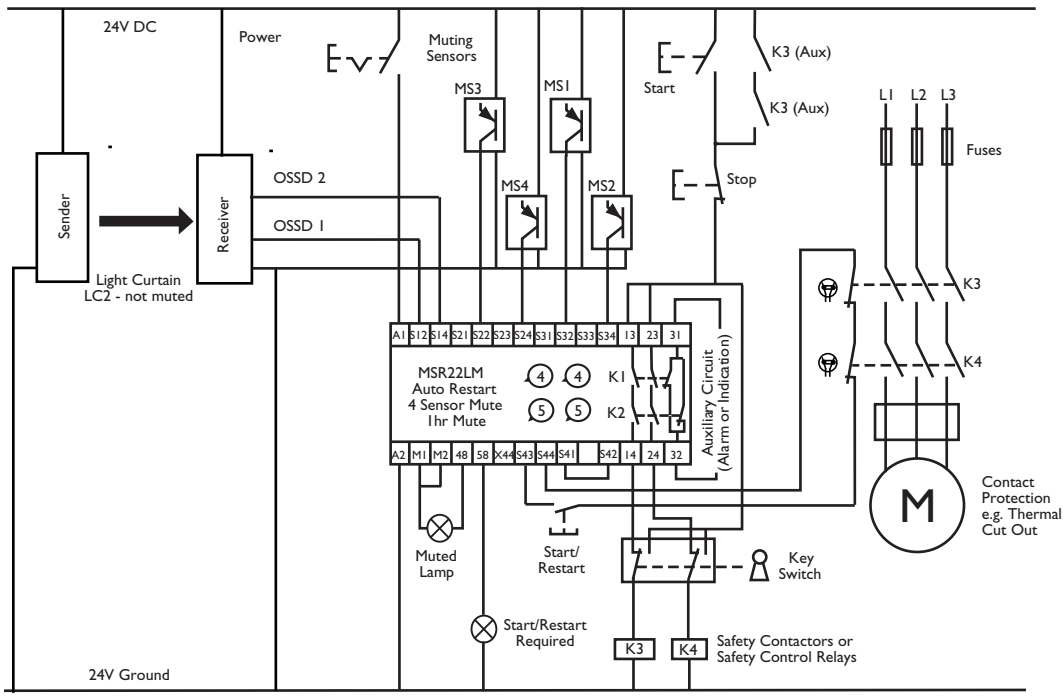
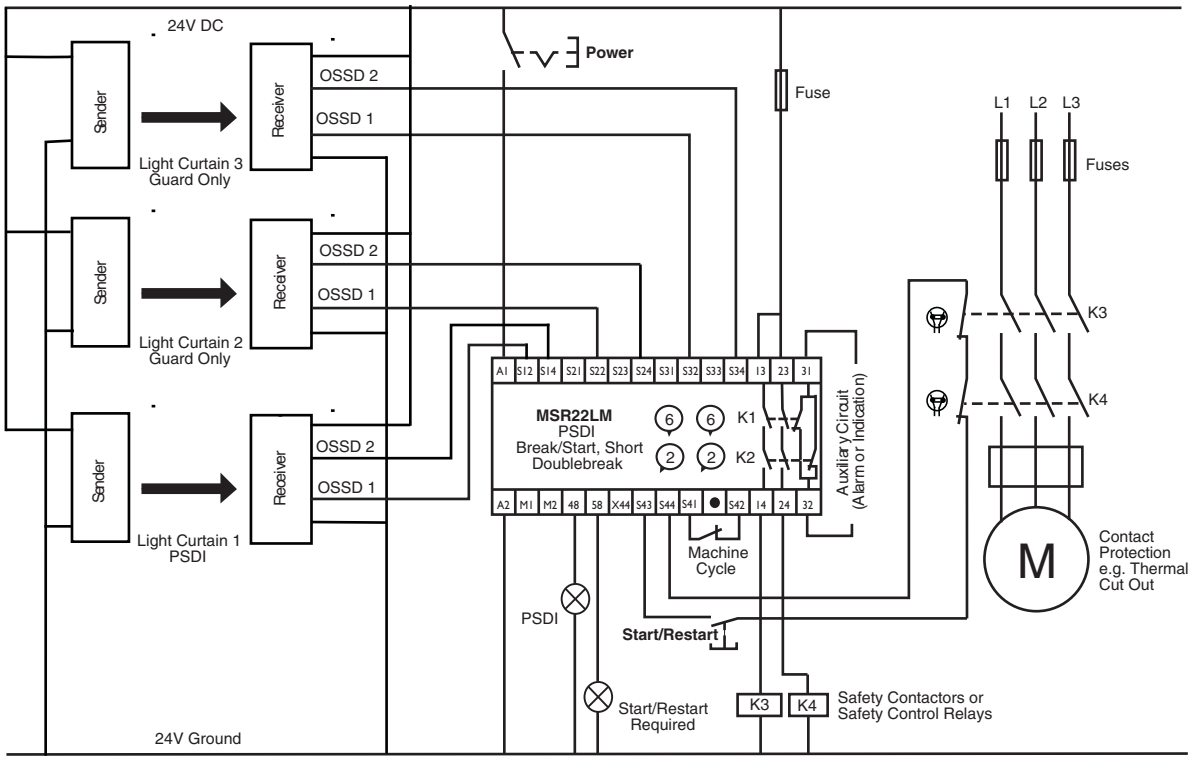
Typical Wiring Diagrams



Note: Two light curtains with two-sensor muting and Auto Restart LC1.



Note: Typical one light curtain with four-sensor muting and Auto Restart LC1.



Note: Light curtain inputs, Presence Sensing Device Initiation (on LC1) Start/Restart Interlock, Dual Channel Output, Output Monitoring.

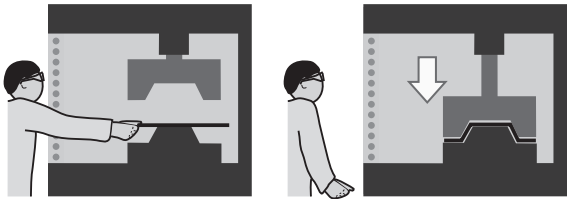
Application Details

MSR22LM—Shown connected to a safety light curtain.

Multiple settings are available offering a variety of advantages. Below are the three most common settings.

Protective Mode

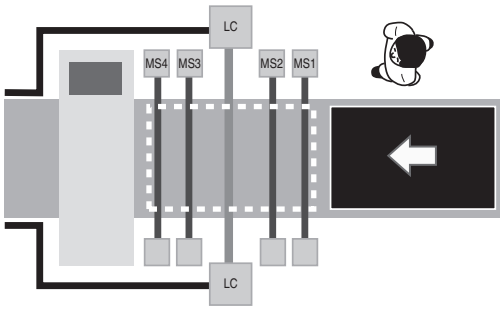
Example shows a press protected by a safety light curtain connected to the MSR22LM.



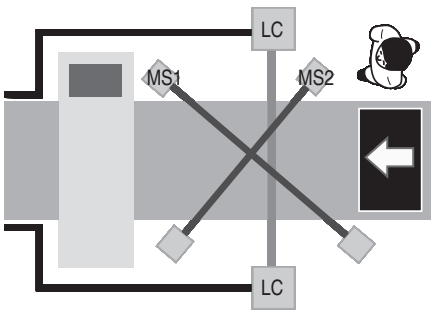
In machine operation, whenever the light curtain beams are broken the press immediately stops to help avoid danger to the operator. Once the beams are cleared the machine can then be started.

Muting Mode

Two examples are shown, both conveyor applications with a safety light curtain protecting the dangerous area. In-line and cross beam muting is used to allow the material to pass through the light curtain without stopping the machine. Any other object or person will be detected by the light curtain which will initiate machine stop.



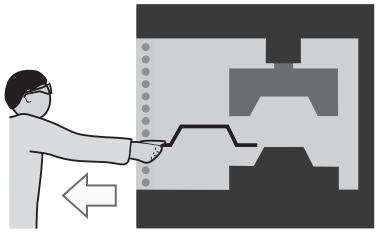
In-line muting requires the material to break the beams in a sequence, as shown. Only if all four MS beams are broken in turn and then clear in turn will the light curtain allow material through without initiating machine stop.



Cross-beam muting requires the material to break the beams in a sequence. MS1 first and then MS2. Only if the beams are broken in turn and then clear in turn will the light curtain allow material through without initiating machine stop.

Auto Initiation Sequence (Stepping)—Double Break Shown

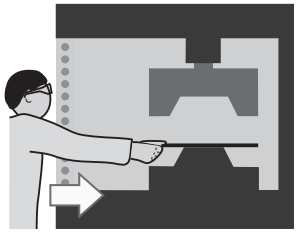
Auto initiation allows the machine to start and stop according to the number of times the light curtain beams are broken and cleared. Illustrated below is the MSR22LM set to auto initiation double break mode (after initial start-up sequence). Single- or three-break modes can also be selected.



First break—processed material removed

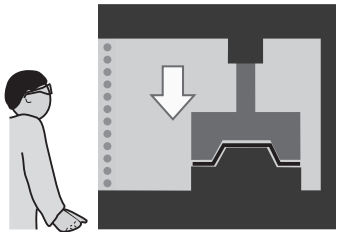
First clear—light curtain clear

Machine remains in stop mode



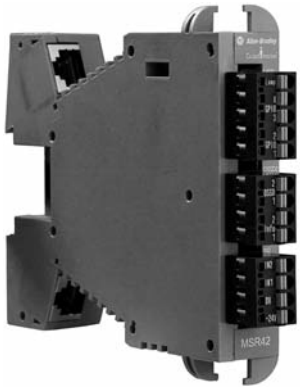
Second break—new material inserted

Machine remains in stop mode



Second clear—light curtain clear

Machine starts. Upon completion of cycle first break will start sequence again.



Description

The MSR42 multi-function safety relay is the control module for the GuardShield Micro 400 safety light curtain, but can also be used with any light curtain. This versatile Category 4 safety device has a pair of PNP solid state, 400 mA OSSDs for direct connection to the final switching device. When safety relay outputs are required, the MSR42 easily accommodates the interconnection of up to three MSR45E safety relay expansion modules, each providing a pair of safety relay outputs. Simply connect ribbon cable connectors from the back of the MSR42 to each of the MSR45E modules for a series of interconnections for two PNP OSSDs, and six N.O. relay outputs.

The MSR42 has four software configurable inputs. These configurable safety inputs allow the connection of a multitude of safety devices such as safety light curtains, safety laser scanners, e-stops, safety switches, etc.

This 22.5 mm DIN mount multi-function safety module has both hard wired and software configurable operating modes. The removable spring terminal connectors on the MSR42 allow for ease of wiring of the device as well as hard-wired operating mode configuration.

Manual/automatic reset and start/restart can be configured by simply changing the wiring (see basic configuration examples).

Features such as two or four sensor muting, connecting up to two additional safety light curtains or other safety devices and configuring one or two auxiliary outputs are easily configured using the optical interface with the supplied software.

The MSR42 and Micro 400 light curtains support fixed blanking which is only available in the basic configuration mode and configured through a "teach-in" selector switch via the GPIO pins.

Features

- Category 4 per EN 954-1
- SIL CL3 IEC 61508, IEC 62061
- 22.5 mm housing
- Stop category 0, 1
- 24V DC supply voltage
- Manual, monitored or automatic reset
- Thirteen diagnostic LEDs
- Unique design allows for easy addition of relay expansion modules
- Removable terminal blocks
- One or two configurable auxiliary, standard outputs
- Connection of one or two additional safety devices
- RJ45 connections for Micro 400 safety light curtain
- Two or four sensor muting (Micro 400 only)
- Fixed blanking (Micro 400 only)
- Two sensor muting all GuardShield light curtains
- Supports up to three MSR45E expander units
- Free configuration software can be downloaded at www.ab.com/safety

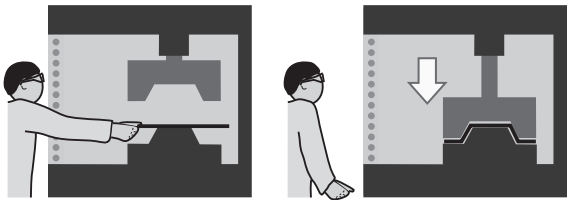
Application Details

MSR42—Shown connected to safety light curtains.

Multiple settings are available offering a variety of advantages.

Protective Mode

Example shows a press protected by a safety light curtain connected to the MSR42.

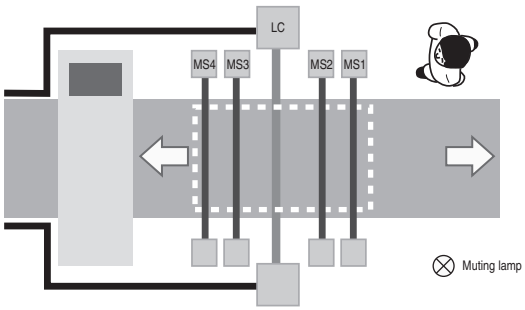


In machine operation, whenever the light curtain beams are broken the press immediately stops to help avoid danger to the operator. Once the beams are cleared the machine can then be started.

Muting Modes

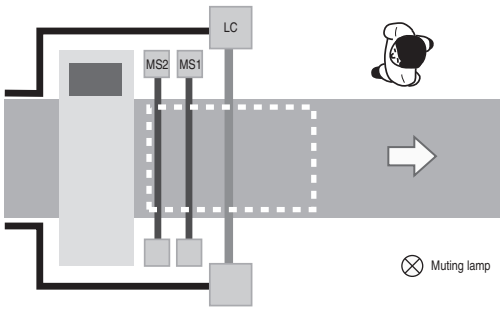
Four conveyor examples: All conveyor applications shown with a safety light curtain helping protect the dangerous area. In-line and cross beam muting is used to allow the material to pass through the light curtain without stopping the machine. Any other object or person will be detected by the light curtain which will initiate machine stop.

Four Sensor T-type



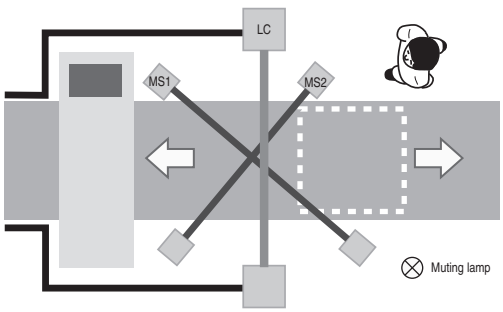
Bi-directional muting: In-line muting requires the material to break the beams in a sequence, as shown. Only if all four muting sensor (MS) beams are broken in turn and then clear in turn will the light curtain allow material through without initiating machine stop.

Two Sensor L-type



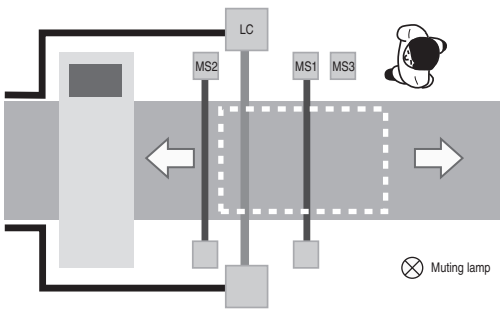
Uni-directional muting: This will allow material to exit the machine but not allow material or personnel to enter the machine without a fault condition. Only if both MS beams are broken in-turn and then cleared in-turn, will the light curtain allow material through without initiating a machine stop.

Two Sensor T-type



Bi-directional muting: Cross-beam muting requires the material to break the beams in a sequence. MS1 first and then MS2. Only if the beams are broken in turn and then clear in turn will the light curtain allow material through without initiating machine stop.

Two Sensor T-type with Enable



Bi-directional muting: The MS3 is an input to the MSR42 from a PLC output card. The MS3 enables the muting function to be performed. If a high signal is not detected on MS3, the muting function will not operate even if the MS1 and MS2 beams are broken. Only if MS3 is high and both MS beams are broken in-turn and then cleared in-turn, will the light curtain allow material through without initiating a machine stop.

Description

The CU2 control unit is a compact timing and stop motion detector interface module. By utilizing two independent inductive proximity inputs, which monitor the movement of two metal parts of the machine (e.g., sprockets, cams or linkages). The control unit detects when hazardous motion has ceased. When the hazardous motion has stopped the unit will send a signal to unlock guard locking devices. It has been developed to integrate guard locking interlock switches on machines which have variable or unpredictable run down cycles.

A removable cover allows access to the DIP switches and potentiometer which control the timing. The on-delay may be adjusted between 0.1 seconds to 40 minutes, through a series of 4 broad time ranges. The final adjustment is made by a potentiometer.

The Y1/Y2 terminals provide a check of contactors at machine power up. This is only relevant to certain special applications. For normal use these terminals should be linked. After all motion has ceased, the normally open safety on contacts close, which may be used to energize electrically operated solenoid locking guard switches. In addition the normally closed contacts open to indicate the unit's status.

LED indication in the unit displays power, timer on, and outputs.

Features

- Category 1 per EN 954-1
- Stop category 1
- NPN and PNP inputs
- Timed off-delay 0.1 s…40 min
- Two N.O. safety outputs
- One N.C. auxiliary output

5-Safety Relays

Description

Bulletin 872C WorldProx inductive proximity sensors are self-contained, general purpose, solid-state devices designed to sense the presence of ferrous and nonferrous metal objects without touching them.

The switch body consists of a plastic face and a nickel-plated brass barrel. It meets NEMA 1, 2, 3, 4, 6P, 12, 13 and IP67 (IEC 529) enclosure standards. The electronic circuitry is fully potted for protection against shock, vibration, and contamination.

The CU2 is designed to operate with one normally-open NPN and one normally-open PNP inductive proximity sensor.

The sensors translucent end caps glow when the LED indicator is on, and are visible from almost every angle.

The sensors contained in this section are some of the more popular size inductive proximity sensors. See the Rockwell Automation/ Allen-Bradley Sensors catalog for an extensive range of proximity sensors.

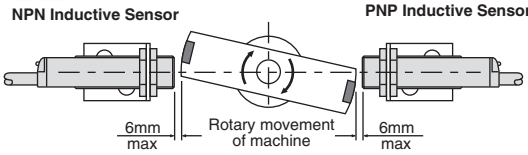
Application Details

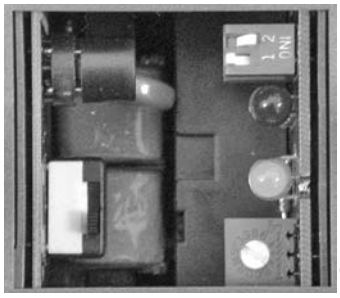
Application Accessories

PNP and NPN Inductive Sensors for use with CU2
Sensors detect when motion has ceased by monitoring two targets on moving metal parts. When motion has ceased the CU2 begins timing down. Once preset time limit has been passed the CU2 sends a single allowing locked guard to be opened.

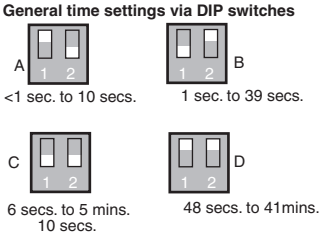


CU1 remote indication unit:
A remote indication unit to indicate the status of the circuit can be connected to the CU 1s, R1, R2 and R3 connections.

Adjustable Time Delay
DIP switches general time setting and the potentiometer fine tunes the time settings. Easy access 500 mAT replaceable fuse.



General time settings via DIP switches



Fine adjustment time setting via potentiometer

Specialty Safety Relays

MSR57P Safe Speed and Standstill Monitor

Description

The MSR57P speed monitoring safety relay is designed to solve motion applications which require interaction by personnel during operation. It connects to any drive and monitors the speed using currently installed encoders. The MSR57P can be configured to unlock the access door only when the machine is either stopped or at a safe speed defined by the user. If required, the speed monitoring relay can monitor an enabling switch to constantly monitor personnel while in the hazardous area. Other supported functions are safe maximum speed and zero speed detection.

The MSR57P can be configured and monitored via two methods: drive explorer using a PC and the standard HIM device. During configuration, the user can set a variety of parameters to the specific requirements of their application including type of input devices, quantity, door locking and monitoring, enabling switches and a maintenance (safe speed) mode.

The MSR57P can easily be adapted to current installations with standard drives or drives with the safe-off feature. The safety relay uses standard outputs to control the drives speed but uses safety outputs to control the outputs of the drive. The speed is determined by using an encoder(s). This device can monitor the encoder data which is already transmitting to the drive, assuming an encoder is already installed, or a new encoder can be installed and only connected to the MSR57P. Two encoders are needed for Category 4, SIL 3 applications which cannot exclude shaft slippage and breakage.

This device also supports multiple axis applications. During configuration, it can be setup to be the first, middle or last axis in the chain. This is important since the input devices will all be installed on the first unit only while the output devices are connected to the last MSR57P in the chain.

Features

- SIL 3 IEC 61508
- Category 4 per EN 954-1
- Stop category 0, 1, 2
- Six N.O. solid-state safety outputs
- Four solid-state auxiliary outputs
- One or two encoders (sin/cos and TTL)
- Eight diagnostic LEDs
- DPI configuration port
- 67.5 mm DIN Rail housing
- Removable terminals

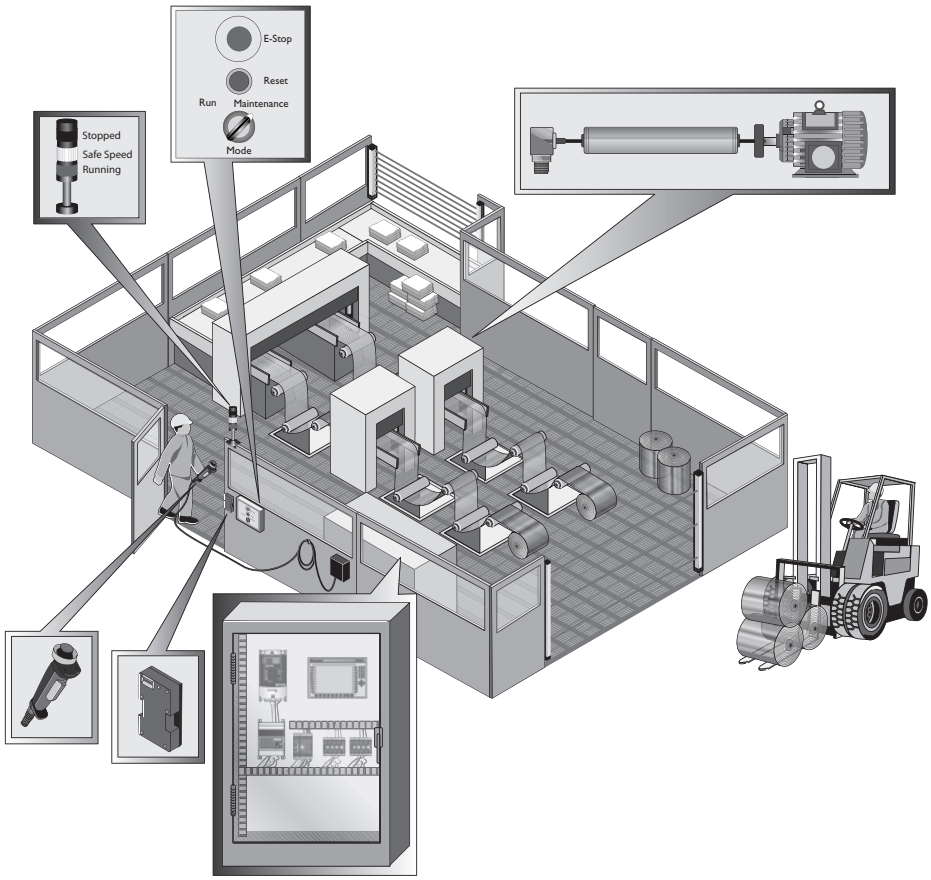
Note: Cat. 1 stop, 1 encoder, door monitoring, enabling switch, safe limited speed, PowerFlex 70 with safe off.

Application Details



Operating Conditions

- The door is closed and locked with a TLS3 safety switch
- The machine is running at normal speed

Maintenance Conditions

- In order to remove a jam condition or during start-up personnel must enter the hazardous area.
- The operator moves Limited Speed Selector switch to “enable.”
- The MSR57 monitors speed profile and verifies drive is reducing speed per the preconfigured profile.
- Once the speed is equal to or below limited speed value, the door is unlocked.
- If configured, user must hold enabling switch in the middle position before opening door. Otherwise the machine will shutdown.
- The operator performs maintenance on the machine.
- Once maintenance is complete, the operator exits machine, closes door and moves the safe limited speed switch to "maintenance" mode BEFORE releasing the enabling switch.
- The machine will resume normal speed according to the drive profile.

Remarks

- The MSR57 can also monitor if the speed has exceeded a preconfigured value and shutdown the process.
- The MSR57 is compatible with all drives and uses standard inputs on the drive to perform controlled start and stop sequences.
- Pressing the E-stop at any time, will cause the machine to stop according to the preconfigured stop mode.
- The MSR57 can also be used in cascading applications with multiple MSR57s and drives.

Description

The CU3 is a control unit which detects stopped motion and is ideal for use with guard locking interlock switches. It is designed to interface with single or three-phase induction motors by measuring the drive voltage and the back electro-magnetic field (emf) of the motor.

The front window of the CU3 can be popped off to reveal a replaceable fuse and a potentiometer. The potentiometer sets the threshold voltage measured at terminals Z1/Z2. The maximum threshold voltage is approximately 2.5V peak (potentiometer turned fully CCW). When the voltage at Z1/Z2 exceeds the threshold voltage, the safety outputs de-energize, and the safety contacts at terminals 13/14 and 23/24 open.

When the supply to a motor is disconnected, motor speed will reduce to zero. During the run down period the back emf generated by the motor is monitored by the CU3. When the level of the back emf dips below the threshold voltage, the safety outputs close. This enables the output device (e.g., solenoid locking or unlocking switch) to be activated.

If the Z1/Z2 circuit opens, the CU3 goes into a fault state, indicated by the fault led. The fault must be corrected and the power to the CU3 cycled to clear the fault state.

The 24V DC version must be operated with an isolated supply. The CU3 is not intended for use with variable frequency drives.

Features

- Category 1 per EN 954-1
- Stop category 1
- Two N.O. safety outputs
- One N.C. auxiliary output
- Automatic/manual, monitored reset supported
- Motor voltage up to 500V max.

LED Indicators

MSR23M Mat Controllers

Description

The MSR23M control unit is designed to monitor four-wire safety mats that are connected together to form a safeguarded zone. The size of the safeguarded zone is limited by the total input impedance (100 ohms maximum) created by the wiring and connections. The controller is designed to interface with the control circuit of the machine and includes two safety relays to help provide control redundancy.

The controller detects a presence on the mat, a short circuit, or an open circuit. Under each of these conditions, the safety output relays turn off. When interfaced properly, the machine or hazardous motion receives a stop signal, and an auxiliary output turns ON.

Features

- Category 4
- Stop category 0
- Removable terminals
- Monitored or automatic/manual reset
- Four-wire safety mats sensing

LED Indicators

MatGuard™ Controllers Safety Relays

Description

The MatGuard Control Unit monitors all of the mats which are connected together to form a safeguarded zone. The safeguarded zone can be up to a total of 100 m^2 and made from any number of mats. The controller is designed to interface with the control circuit of the machine and includes two safety relays to help provide control redundancy.

The controller detects a presence on the mat, a short circuit, or an open circuit. Under each of these conditions, the safety output relays turn off. When interfaced properly, the machine or hazardous motion will receive a stop signal, and an auxiliary output relay turns ON.

The controller comes in two different package styles, a plastic case for surface or wall mounting, and a steel case for surface or wall mounting. Each style offers many of the same basic features. Each controller accepts power supplies of 24V AC/DC, and 110/230V AC. The plastic and steel-cased styles include reset buttons. The steel-cased controller offers extra protection against inadvertent impacts.

Alternatively, see the Product Selection table for safety relays that can also control and monitor safety mats.

Features

- Selectable voltage supply
- Auto/manual reset
- Four-wire system to detect opens and shorts
- Third party approval—AMTRI, TÜV

MatGuard™ Mat Manager

Description

The Safety Mat Manager is designed to monitor multiple safety mats, each with its own connection. The Safety Mat Manager accepts up to eight individual mats with four-pin micro quick disconnect connectors.

The Safety Mat Manager provides an LED status indication for each of the mat connections. Since the LEDs indicate whether the mat is shorted or open, troubleshooting and replacement of a damaged mat within a mat system, is much quicker when compared to a traditional mat system where multiple mats are wired in series.

An internal switch allows for the setting of the reset to automatic/manual or monitored manual. When set to automatic/manual, the reset circuit can be jumpered, connected auxiliary contacts, or connected to an unmonitored manual reset by adding a momentary normally open switch in the monitoring loop. When set to monitored manual, the monitoring circuit must be closed and then opened to activate the outputs.

Stepping on any one of the mats deactivates the safety outputs. The outputs include two or six normally open safety rated outputs used to shut down the machine and one normally closed or normally open auxiliary output to indicate the status of the Mat Manager. The safety outputs have independent and redundant internal contacts to support the safety function.

Features

- Accepts up to eight individual mats
- Two or six safety output contacts
- One auxiliary output contact
- Automatic/manual or monitored manual reset

Safedge™ Controllers

Description

The Safedge controllers are designed to operate with the Safedge profiles. The controller continuously monitors the profile for actuation and generates an output signal when the profile is depressed.

The Safedge controller provides a low voltage to the profile. When the profile is pressed, the controller detects a change in resistance and turns off its output relays. When pressure is released from the profile, the output relays of the controller return to an on state. The controller has redundant voltage free positively-guided output relays, which can be used to interface with a machine control system.

The 251 controller comes capable of operating at 24V AC/DC, or 120/230V AC from separate terminals. An internal switch changes the operating voltage from 120V AC to 230V AC. The 252 controller operates at 24V AC/DC.

An auxiliary output relay is available to provide a signal about the controller's status. Three LEDs indicate whether the controller is in RUN, STOP or OPEN condition. The controller operates in manual or automatic reset mode.

Features

- One N.O. or two N.O. safety outputs
- One N.C. auxiliary output
- 24V AC/DC or 120/240V AC
- Output monitoring
- LED indicators for RUN, STOP, and OPEN
- Automatic/manual reset

Sipha Control Units

Description

With the increasing speed and complexity of applications a simple magnetic switch may be insufficient to meet the increased risks, therefore Sipha's design incorporates several magnetically sensitive elements which must be triggered in a particular sequence to operate correctly. The Sipha sensor, designed to operate with its own actuator, helps prevent defeatability by a simple magnet.

The control unit is available in three types. The Sipha 1 control unit operates on 24V AC/DC and offers one normally open safety output and one normally closed solid-state auxiliary output. The Sipha 2 control unit operates on either 24V AC/DC, 110V AC or 230V AC and offers two normally open safety outputs and one normally closed auxiliary output. The Sipha 6 has wiring terminals for up to six sensors, a delayed output for Category 1 stops and offers the same wide range of power supply capability as the Sipha 2 control unit. Between two and six Sipha sensors can be directly connected to the Sipha 6 control unit. An internal DIP switch mutes the unused connections to sensors 1, 2, 3 and 4. This allows for individual monitoring to each interlock and provides enhanced safety integrity when compared to six interlocks running off a single Sipha 2 control unit.

The Sipha control units are designed to operate with the Sipha sensors and actuators. The controllers have automatic reset.

Features

- Noncontact actuation
- Magnetic coded sensing
- Control unit acts as safety relay
- Four types of switches

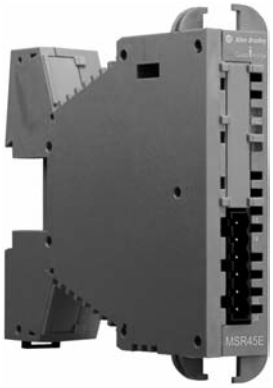
Expansion Safety Relays

MSR45E



Description

The MSR45E is a safety relay expansion module for the MSR41/MSR42 (MSR4x) multi-function safety controller. The MSR45E comes in 22.5 mm DIN housing and is designed to easily connect to the MSR4x. The MSR45E safety relay expansion module is a Category 4 module with externally monitored contactors via the MSR4x. Interconnecting these devices is as simple as plugging ribbon-cable connectors to the back of each module. Up to three MSR45E safety relay expansion modules may be interconnected to an MSR4x. The ribbon-cable connectors must be ordered separately based on the number of MSR45E units that are attached to the MSR4x.

Features

- Category 4 per EN 954-1
- SIL CL3 per IEC 61508
- Stop category 0 or 1
- Two safety contacts N.O.

Expansion Safety Relays with Delayed Outputs

MSR132E

Description

The Minotaur MSR132E is a monitoring safety expansion relay unit with single or dual channel input and either immediate or timed off-delay outputs. It is designed to be operated as an “extension” of a “master” safety relay. When wired properly, the outputs of the MSR132E will mimic the outputs of the master relay.

The outputs include four normally open safety rated outputs used to shut down the manufacturing system and two normally closed auxiliary outputs to indicate status of the MSR132E. One additional normally closed output is available to allow the host relay to monitor the status of the MSR132E. The safety, auxiliary and monitoring outputs have independent and redundant internal contacts to support the safety function.

A delayed output version is also available (MSR132ED) that have off-delayed outputs with a fixed time without the need for an auxiliary supply during the off-delay time.

Features

- Category 4/3 per EN 954-1
- Stop Category 0 or 1
- Four safety contacts N.O.
- Two auxiliary contacts N.C.
- One monitoring contact N.C.
- Single channel input

Input Module Selection

To determine the base module and input modules needed, start on the left side and count down the number of OSSD input devices you have to connect to the system. Then move to the right according to the number of non-OSSD input devices you need, such as 1 N.C. or 2 N.C. input devices. Count the modules and this will be your total required for the system.

# of OSSD Inputs \ # of non-OSSD Devices	0	1 2	3 4	5 6	7 8	9 10	11 12	13 14	15 16	17 18	19 20	21 22
0		**MSR210**	MSR220	MSR220	MSR220	MSR220	MSR220	MSR220	MSR220	MSR220	MSR220	MSR220
1 2	**MSR211**	MSR220	MSR220	MSR220	MSR220	MSR220	MSR220	MSR220	MSR220	MSR220	MSR220	
3 4	MSR221	MSR220	MSR220	MSR220	MSR220	MSR220	MSR220	MSR220	MSR220	MSR220		
5 6	MSR221	MSR220	MSR220	MSR220	MSR220	MSR220	MSR220	MSR220	MSR220			
7 8	MSR221	MSR220	MSR220	MSR220	MSR220	MSR220	MSR220	MSR220				
9 10	MSR221	MSR220	MSR220	MSR220	MSR220	MSR220	MSR220					
11 12	MSR221	MSR220	MSR220	MSR220	MSR220	MSR220						
13 14	MSR221	MSR220	MSR220	MSR220	MSR220							
15 16	MSR221	MSR220	MSR220	MSR220								
17 18	MSR221	MSR220	MSR220									
19 20	MSR221	MSR220										
21 22	MSR221											

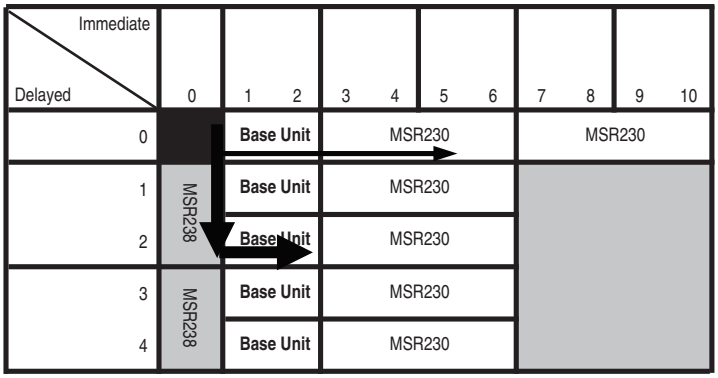
Example 1: 7 OSSD inputs and 5 non-OSSD inputs required.
Solution: MSR211, 3 MSR221, and 3 MSR220.

Example 2: 9 non-OSSD inputs required.
Solution: 1 MSR210 Base, 4 MSR220.

Note: This selection chart assumes that **if** you have OSSD input devices, they will be connected to the base module. If you do **not** want this, then change the MSR211 to the MSR210 and change one MSR220 to an MSR221. This will provide you the same system, but now the OSSD input device will not be on the base module.

Output Module Selection

Start at the top left and count the number of delayed outputs required. Then count across the number of immediate outputs required. Ensure you only have a total of two output modules total.



Example 1: 2 Delayed outputs and 2 Immediate outputs

Solution: (black lines) One MSR238, 2 Immediate outputs built in the base module

Example 2: 5 Immediate outputs required

Solution: (red line) 1 MSR230 Output module and 2 immediate outputs built into base module

Note: The base module has two N.O. safety outputs built in.

Modular Safety Relays

MSR210P

Description

The MSR210P forms one of the base units for the modular Minotaur MSR200 family of monitoring safety relays. It can be combined with other modules of the MSR200 Series to configure a safety control system with numbers of inputs and outputs matching users' specific application requirements, as well as diagnostic and networking capabilities. Up to ten input modules and two output modules can be connected to one base unit by simply removing the terminator, included with each base unit, and connecting the ribbon cables of the neighboring module. The terminators must be inserted into the final input and output modules.

The MSR210P has two inputs. Each input can be wired in one of four ways: one normally closed, two normally closed, three normally closed, safety mat connections. The MSR210P uses pulsed input monitoring to check for faults to power, ground or between inputs before a demand is placed on the safety system. Connecting a single device (must be at least dual channel) to each input meets the requirements of Category 4 per EN 954-1.

The MSR210P has the capability to perform external device monitoring (EDM). The EDM capability works in conjunction with the reset option. The user selects EDM and the reset function by jumpers across terminals Y40, Y41 and Y42.

The MSR210P has two semiconductor outputs designed to send status information to a PLC. Terminal Y33 indicates the inputs are closed (the ready LED is on). Terminal Y32 indicates the outputs are active.

The outputs include two normally open safety rated outputs and one normally closed auxiliary output.

Features

- Category 4 per EN 954-1
- Stop category 0
- Pulsed input monitoring
- Two input circuits: safety gate, E-stop or safety mat
- Up to 22 diverse input devices
- Two safety outputs, three auxiliary outputs
- Ten diagnostic LEDs
- Removable terminals

Modular Safety Relays

MSR211P

Description

The MSR211P forms one of the base units for the modular Minotaur MSR200 family of monitoring safety relays. It can be combined with other modules of the MSR200 Series to configure a safety control system with numbers of inputs and outputs matching users' specific application requirements, as well as diagnostic and networking capabilities. Up to ten input modules and two output modules can be connected to one base unit by simply removing the terminator, included with each base unit, and connecting the ribbon cables of the neighboring module. The terminators must be inserted into the final input and output modules.

The MSR211P has two inputs. Each input can be wired in one of three ways: one normally closed, two normally closed, or two OSSD connections from a light curtain. The MSR211P does not perform cross fault monitoring, and would not detect a short across the inputs of a two normally closed input. When connected to light curtains, the light curtain must perform the cross fault detection.

The MSR211P has the capability to perform external device monitoring (EDM). The EDM capability works in conjunction with the reset option. The user selects EDM and the reset function by jumpers across terminals Y40, Y41 and Y42.

The MSR211P has two semiconductor outputs designed to send status information to a PLC. Terminal Y33 indicates the inputs are closed (the ready LED is on). Terminal Y32 indicates the outputs are active.

The outputs include two normally open safety rated outputs and one normally closed auxiliary output.

Features

- Category 4 per EN 954-1

Modular Safety Relays

MSR220P

Description

The MSR220P is an input expansion module for the modular Minotaur MSR200 family of monitoring safety relays. It can be connected to either the MSR210P or MSR211P to provide additional inputs.

Up to ten input modules can be connected to a base unit by simply removing the terminator, included with each base unit, and connecting the ribbon cables of the neighboring module. The connecting ribbon cable provides power to the MSR220P as well as a check on its status. The terminators must be inserted into the final output module. The input modules to a base unit can be either MSR220P or MSR221P in any combination or order.

The MSR220P has two independent inputs, which can be wired in one of five ways: one normally closed, two normally closed, three normally closed, one normally closed and one normally open or a safety mat. When used with the MSR210 base unit, the inputs to the MSR220 are continuously pulse-checked for shorts to power, ground and across inputs. Connecting a single device (must be at least dual channel) to each input meets the requirements of Category 4 per EN 594-1.

Four LEDs provide status information on the inputs. Green indicates the input is closed and red indicates the input is open.

Features

- Category 4 per EN 954-1
- Stop category 0
- 17.5 mm DIN Rail housing
- Two input circuits: safety gate, E-stop or safety mat
- Four diagnostic LEDs
- Removable terminals

Modular Safety Relays

MSR221P

Description

The MSR221P is an input expansion module for the modular Minotaur MSR200 family of monitoring safety relays. It can be connected to either the MSR210P or MSR211P to provide additional inputs.

Up to ten input modules can be connected to a base unit by simply removing the terminator, included with each base unit, and connecting the ribbon cables of the neighboring module. The connecting ribbon cable provides power to the MSR220P as well as a check on its status. The terminators must be inserted into the final output module. The input modules to a base unit can be either MSR220P or MSR221P in any combination or order.

The MSR221P has two independent inputs, which can be wired in one of three ways: one normally closed, two normally closed, or a light curtain. When connected in the two normally closed configuration, the MSR221P does not perform cross fault monitoring (i.e., checks for shorts between the two inputs).

Four LEDs provide status information on the inputs. Green indicates the input is closed and red indicates the input is open.

Features

- 17.5 mm DIN Rail housing
- Two input circuits: gate, E-stop or light curtains
- Four diagnostic LEDs
- Removable terminals

Modular Safety Relays

MSR230P

Description

The MSR230P is an output expansion module for the modular Minotaur MSR200 family of monitoring safety relays. It can be connected to either the MSR210P or MSR211P base unit to provide additional outputs.

Up to two MSR230P output modules can be connected to one base unit by simply removing the terminator, included with each base unit, and connecting the ribbon cables of the neighboring module. The connecting ribbon cable provides power to the MSR230P as well as a check on its status. The terminators must be inserted into the final output module.

The MSR230P has four safety rated outputs that work in parallel with the safety outputs of the base unit. When the output of the base unit is activated, the outputs of the MSR230P are also activated.

The outputs are four normally open safety rated outputs. The safety outputs have independent and redundant internal contacts to help support the safety function.

Features

- Four N.O. safety outputs
- Two diagnostic LEDs
- Removable terminals

Modular Safety Relays

MSR238DP

Description

The MSR238 is an time-delayed output expansion module for the modular Minotaur MSR200 family of monitoring safety relays. It can be connected to either the MSR210 or MSR211 base unit or to the MSR230 output module to provide time-delayed outputs.

Up to two output modules can be connected to one base unit by simply removing the terminator, included with each base unit, and connecting the ribbon cables of the neighboring module. The connecting ribbon cable provides power to the MSR238 as well as a check on its status. The terminators must be inserted into the final output module.

The MSR238 has two safety rated outputs that work in parallel with the safety outputs of the base unit. When the output of the base unit is de-activated, the outputs of the MSR238 are de-activated after the time delay expires. The time delay is set by connecting jumpers to the wiring terminals.

The outputs are two normally open safety rated outputs. The safety outputs have independent and redundant internal contacts to help support the safety function. The delayed normally closed output is an auxiliary signal that must only be used to indicate the status of the MSR238.

Features

- Category 3 per EN 954-1
- Stop category 1
- Two diagnostic LEDs
- Removable terminals
- Two N.O. delayed safety outputs
- One N.C. delayed auxiliary output

Modular Safety Relays

MSR240P

Description

The MSR240P is a communications module for the modular Minotaur MSR200 family of monitoring safety relays. It can be connected to either the MSR210P or MSR211P base unit to provide diagnostic and status information to remote devices like the MSR245P display.

The MSR240P is connected in place of the terminator plug to the free bus connector of the Basic Module or the last connected Expansion Module, depending on the system configuration. Data transfer and power supply are routed through the same bus cable and connectors.

A green LED in the front of the MSR240P indicates the presence of supply voltage. A blinking yellow LED signals data exchange activity through the RS232/RS485 interface.

The transmission rate for the RS485 can be set with the help of two DIP switch segments at 2400, 4800, 9600, or 19200 baud.

The station address can be set by five additional DIP switch segments. Up to 32 stations can be connected onto a single RS485 network.

The connected supervisory monitoring or data acquisition system can process and store the data, display it, and record the reason causing a shutdown, along with the time and date of each such occurrence. This makes fault diagnosis much easier.

Features

- Data transmission
- RS232 or RS485
- Supported baud rates: 2400, 4800, 9600, or 19200
- Galvanically isolated interfaces
- 17.5 mm DIN Rail housing
- Two diagnostic LEDs
- Removable terminals

Modular Safety Relays

MSR241P

Description

The MSR241P is a DeviceNet™ communications module for the modular Minotaur MSR200 family of monitoring safety relays. It can be connected to either the MSR210P, MSR211P, or MSR230P modules to provide diagnostic and I/O status information to remote locations.

The MSR241P is connected via the flat ribbon cable to the base module or the last connected expansion module, depending on the system configuration. Data transfer and power supply are routed through the same bus cable and connectors.

The MSR241P has two nonsafety rated relay outputs that are activated with the last two bits of the one input byte.

The baud rate and address is set by means of the dipswitch on the front panel.

The connected supervisory monitoring or data acquisition system can process and store the data, display it, and record the reason causing a shutdown, along with the time and date of each such occurrence. This makes fault diagnosis much easier.

Features

- DeviceNet™ data transmission
- Switch selectable baud rates: 125 K, 250 K, 500 K
- Switch selectable address
- 45 mm DIN Rail housing
- Four diagnostic LEDs
- Removable terminals
- Group two only slave

Modular Safety Relays

MSR245P

Description

The MSR245P is a display module for the modular Minotaur MSR200 family of monitoring safety relays. The MSR245P Display Module is interfaced to an MSR200 system through an MSR240P Communication Module, using the RS232 interface, with a two-core shielded cable. The display is refreshed approximately every six seconds.

Using the four-line LCD display and the three function key-switches, the configuration of external circuits, and the on-off status of all inputs of the system can be checked and interrogated.

The microprocessor, in the base module, scans all the inputs starting with the base module and working its way to the left. The first scanned input is “base module input 1.” The last scanned input would be input two of the module furthest from the base module.

The display shows the lowest scanned input that de-energized the safety outputs (safety outputs open). After the lowest scanned input is cleared, the display will refresh and show the next input which is open. In this way, each open input circuit can be troubleshot and closed. When all inputs are closed, the user can scroll through the display.

The MSR245P requires 24V DC supply voltage. The power supply input as well as the RS232 are galvanically isolated from the MSR200 system, but can be connected non-isolated if required.

The messages in the MSR245 are capable of being customized with application specific text. The first three lines of the display can be changed to describe each of the inputs (3 x 20 characters). The text language can be selected and written in either English or German.

For programming, a PC running under Windows™ must be connected to the nine-pole sub-miniature D connector on the back of the MSR245 using a standard serial data interface cable.

The program allows the user to generate and transfer the text blocks into the nonvolatile memory of the MSR245.

The software for text programming and the manual is available for download on the Rockwell Automation safety website at *www.ab.com/safety*.

Features

- Recalls and displays system information
- Simple menu selection
- Stores details of last registered stop occurrence
- Clearly readable backlit display
- Back-lit four-line alphanumeric display
- RS232 interface

Configurable Safety Relays

MSR310P RS232

Description

The MSR310P is one of the base units available for the MSR300 system. It can be combined with other modules of the MSR300 Series to configure a safety control system with numbers of inputs and outputs matching users' specific application requirements, as well as diagnostic and networking capabilities. Up to ten input modules and six output modules can be connected to one base unit by simply removing the terminator, included with each base unit, and connecting the ribbon cables of the neighboring module. The terminators must be inserted into the final input and output modules. A fully utilized system can support up to 20 inputs devices (e-stops/gates) and 18 normally open outputs.

The MSR300 System supports up to three group outputs. The input modules can be configured to control one or more of the output groups. This creates flexibility for the customer to solve applications requiring simple logic functions (simple AND and OR function). No software is needed for configuration, only rotary switches on the Input Modules are required. Please see the Input Modules for more information.

The base module supports multiple reset configurations for each group output. The user can select from the following choices: manual, manual monitored and automatic reset. The reset configuration is set up by jumpers on the base module terminals. If manual monitored and automatic reset is mixed, the preferred combination of Output Group Modules should be considered.

The MSR310P base module does not have any inputs or safety outputs within the device. A minimum of one input module and one output module are required to make a functional system. The base module does have three solid-state auxiliary outputs to signify the status of the output groups—one output for each Group (1, 2, or 3).

The MSR310P has the capability to monitor external devices individually for each group with a separate feedback loop control.

Features

- Category 4 per EN 954-1
- SIL3 per IEC 61508
- EN 574 Type IIIC
- Stop category 0
- Pulsed input monitoring
- Three auxiliary group outputs
- Six diagnostic LEDs
- Manual, monitored or automatic reset
- Zone control—up to three
- RS232 Diagnostic Comms
- Unidirectional RS232, 4800 baud
- Bidirectional RS232, 2400, 4800, 9600, 19200 baud
- Removable terminals

Configurable Safety Relays

MSR320P Input Module

Description

The MSR320P is an input expansion module for the modular MSR300 family of monitoring safety relays. Up to ten input modules can be connected to a base unit by simply removing the terminator, included with each base unit, and connecting the ribbon cables of the neighboring module. The connecting ribbon cable provides power to the MSR320P as well as a check on its status. The terminator removed from the base module must be inserted into the input module furthest to the left.

Although the base module of the MSR300 system holds all of the configuration information, the input modules are the devices that actually configure the base module. The input modules select both the type of inputs connected and the outputs or groups those inputs will control.

The MSR320P has two independent inputs, which are configured by the rotary switches on the side of the module. There are two switches, for redundancy, so both must be set to the same value. An example of the switch settings is to the right. The selection of the switch setting signifies to the base module what inputs to expect and what to test for. Connecting a single device (must be at least dual channel) to each input meets the requirements of Category 4 per EN594-1. Below is a list of supported inputs.

The MSR320P Input module supports up to three group outputs. Two rotary switches, for redundancy, on the side of the module select the output group or groups the connected inputs will control. Below is an example of the possible group settings.

When three channel N.C. inputs are not chosen, functions switch setting three, one solid-state output is available for each input to provide annunciation for that input.

Two LEDs provide the status information on the inputs. Green indicates the input is closed and red indicates the input is open. Three LEDs provide information regarding which output groups are controlled by this input module.

Features

- Category 4 per EN 954-1
- SIL3 IEC 61508
- EN 574 Type IIIC
- Stop category 0
- 17.5 mm DIN Rail housing
- Five diagnostic LEDs
- Configurable inputs
- Output group configurable
- Removable terminals

LED Indicators

2x input status	Input Closed
Green	Input Open; 3x output switch group assignment

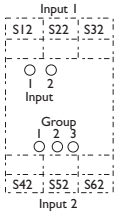
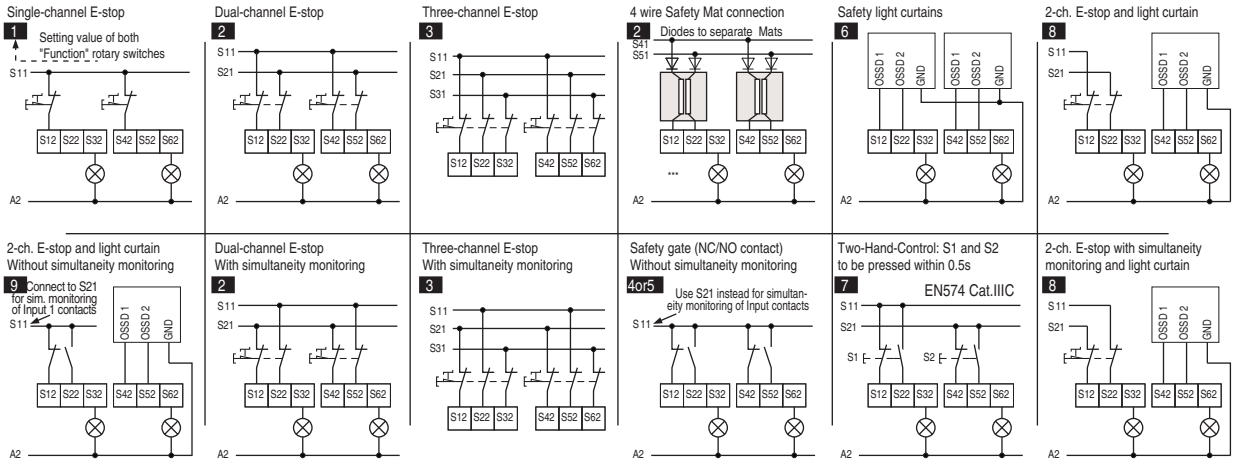
Block Diagram



Typical Wiring Diagrams

Wiring of input according to switch-selected function

Applications in the first row have infinite time to reset the contacts per input. Second row options require the connection per input to be simultaneous reset (within three second time frame). ✶



✶ "Infinite Reset" and "Simultaneous Reset" time refers to the amount of time the user has to close all the contacts of one input without causing a fault condition. Infinite configuration indicates to the base unit NOT to check when the contacts close. Simultaneous reset time requires that all the contacts on each input MUST reset within 3 seconds or a fault/lockout condition will occur.

❄ When applying safety mats to the MSR300, it is recommended to use diodes, as shown, to indicate which mat has been pressed. If only one safety mat is connected to the system, no diodes are needed.

MSR329 Muting Lamp Module

Description

The MSR329P is an input expansion module for the modular MSR300 family to monitor the function of connected muting lamps if the system is setup for a robot cell application. One muting lamp module can be used in each MSR300 system. To use the muting module there must be at least two MSR320P input modules. The muting lamp module can be connected anywhere in the string of input modules but the terminator must be located in the left most module. The connecting ribbon cable provides power to the MSR329P as well as a check on its status. The muting lamp module is used to drive and to monitor the muting lamps only. The MSR320 input module can operate a muted cell operation without the muting lamp module present.

The MSR329P can be used for robot cell applications when the application requires a portion(s) of the inputs devices to the cell to be temporarily disabled. If for example, parts needed to be added or removed from the machine. The light curtain may need to be muted during this time to prevent the machine from stopping during this condition. Interlock switches can be used to determine the position of the robot within the cell to initiate the muting function.

When using the muting module, group three MSR330P output modules are required for the robot control or power. Group outputs 1 and 2 will still change state normally when an input changes state such as a light curtain. Output groups 1 and 2 are not required for robot cell applications but can be used to remove hazardous local voltages such as an arc welder during a muting condition.

The muting module has two main lamp modules and two spare lamp modules. If the main lamp module fails, the spare lamp module will be used. The MSR329P muting module requires an incandescent bulb operating between 30…200 mA to accurately determine the bulb status. LEDs cannot be used. Two LEDs provide the status information on all four lamps. They indicate if the bulbs are okay or if any have failed.

Lamp Outputs

- Two Main Lamps
- Two Auxiliary Lamps

Features

- Category 4 per EN 954-1
- SIL3 IEC 61508
- 17.5 mm DIN Rail housing
- Two Diagnostic LEDs
- Removable terminals

Configurable Safety Relays

MSR330P Output Module

Description

The MSR330P is an output expansion module for the modular Minotaur MSR300 family of monitoring safety relays. Up to six MSR330P output modules and 18 N.O. safety outputs, can be connected to one base unit by simply removing the terminator, included with each base unit, and connecting the ribbon cables of the neighboring module. The six MSR330P output modules can be used in any combination and order when connected to the MSR300 system. The connecting ribbon cable provides power to the MSR330P as well as a check on its status. The terminator must be inserted into the final output module.

The MSR330P has three safety-rated outputs and one auxilary output controlled by the base unit. There are three different MSR330P modules, one for each group. In most instances, the output group module is not specific to each application. The exceptions are robot cell applications and logic or functions which correspond with group three outputs. The safety outputs have independent and redundant internal contacts to help support the safety function.

Features

- Category 4 per EN 954-1
- SIL3 IEC 61508
- Stop category 0
- Three N.O. safety outputs
- One N.C. auxiliary output
- Three group modules available
- Two Diagnostic LEDs
- 22.5 mm DIN Rail housing
- Removable terminals

Configurable Safety Relays

MSR338DP

Description

The MSR338 is an time-delayed output expansion module for the configurable Minotaur MSR300 family of monitoring safety relays. Up to six output modules, can be connected to one base unit by simply removing the terminator, included with each base unit, and connecting the ribbon cables of the neighboring module. The MSR338DP output modules can be used in any combination and order also together with the instant modules MSR330P when connected to the MSR300 system. The connecting ribbon cable provides power to the MSR338DP as well as a check on its status. The terminator must be inserted into the final output module.

There are three different MSR338P modules, one for each group. In most instances, the output group module is not specific to each application. The exceptions are robot cell applications and logic OR functions which correspond with group three outputs.

The MSR338 has three safety rated outputs that work in parallel with the immediate safety outputs of the MSR330P outputs modules. When the output signal from the base unit is de-activated, the outputs of the MSR338 are de-activated after the time delay expires. The time delay is set by connecting jumpers to the wiring terminals. The outputs are three normally open and one normally closed safety rated outputs. The safety outputs have independent and redundant internal contacts to help support the safety function.

Features

- Category 3 per EN 954-1 performance
- Level D per ISO 13849-1 Stop category 1
- Three N.O. safety outputs
- One N.C. safety output
- Three group modules available
- Diagnostic LED
- 22.5 mm DIN Rail housing
- Removable terminals

LED Indicators

Off	Output Inactive
Green	Output Active

Programmable Safety Solutions Overview

Safety PLC systems bring the programmability and flexibility of traditional PLC systems to complex safety applications. Their programmable nature means that safety applications can now be solved in software rather than hard-wiring large, cascaded relay systems. This makes activities such as zone control and simplified machine access procedures much easier to achieve. Safety I/O modules are connected to Safety PLCs via safety certified networks, reducing wiring costs and allowing for advanced diagnostic information to be monitored by the safety PLC and shared with HMI systems. This results in reduced costs associated with wiring, troubleshooting and managing production equipment.

Benefits of safety PLCs include:

- **Flexibility.** Safety PLCs are programmable systems. This allows control engineers to easily design applications in which the behavior of the safety system can be flexible and based on the mode that the machine is currently operating in, the zone of the machine being accessed or the task that an operator or maintenance person is performing. This means that Safety PLCs can be used to help solve applications that are difficult if not impossible to solve with traditional safety relay systems.
- **Productivity.** The flexible programming of Safety PLCs permits control engineers to create maintenance modes of operation with "limited shutdown" capability, allowing for quicker access to production equipment and faster restart times, which help to reduce downtime. The extensive diagnostics also aid in the troubleshooting and repair of the system, improving MTTR (Mean Time to Repair) and further reducing downtime and improving productivity.
- **Wiring Simplification.** Safety input and output devices are wired directly to Safety I/O modules. These modules communicate to Safety PLCs via a single network cable. In applications that require logic or have safety devices distributed around equipment, Safety PLC systems can reduce the amount of wiring and commissioning effort required to install and start up production equipment.
- **Diagnostics.** Safety PLC systems perform internal and external diagnostics checks many times per second. Safety I/O modules also perform checks on their connected input and output devices. This information can be made easily available to operators and service personnel meaning that the exact source of a safety event can often be quickly identified and appropriate action taken, reducing MTTR, getting a machine back into production sooner.
- **Integration.** Safety PLCs enable machine makers to think of safety as part of the normal control of the machine, not just a piece that is added on at the end. Because safety PLCs communicate on standard automation networks, they allow for easy interlocking between the standard control system and the safety system. Some safety systems are so integrated, they can perform all of the standard machine control (sequential, motion, …) plus safety control, all from one unit.
- **Reliability.** Safety PLC systems are designed specifically for very high MTBF (Mean Time Between Failure) and very low PFD (Probability of Failure on Demand).
- **Expandability.** Safety PLC systems are easily expanded. Additional I/O modules can be added to the system and application code can be easily modified and expanded by control engineers.
- **Security.** All safety PLCs have a "Safety Signature" associated with them, a unique identifier that changes whenever any part of the safety configuration or program is changed. This allows for quick spot checks to determine that the safety system is still the way it was when commissioned. Also, some safety PLCs have multiple layers of password protection to allow only authorized personnel to make changes.
- Safety Certification. Safety PLCs are designed to meet stringent standards for programmable safety systems. To demonstrate their compliance, they are certified by professional testing agencies that they meet the appropriate standard. All Rockwell Automation safety systems are certified by the TÜV Rheinland Group for use in applications up to SIL 3 per IEC 61508, and PLe/Category 4 per ISO 13849-1.

Typical applications for safety PLCs include (i) perimeter access control of production cells, robotic systems and complex manufacturing processes and lines, (ii) point of operation control for press and manual loading applications, and (iii) maintenance simplification, alternative methods for lockout/tagout and other applications where users want to streamline the service procedures for production equipment. Safety PLC systems typically consist of (i) a safety PLC where the user-designed application code is executed, (ii) safety I/O which is where safety input and output devices are wired, and (iii) a safety network that allows the safety PLC to communicate with the safety I/O and with each other. The safety PLC system provides you with an environment to write and execute application code with a very high safety integrity. You generate the application code that is executed in the safety PLC system and then, as part of the commissioning process, validate (test) that the safety PLC system mitigates the safety hazards that it was designed to monitor and control.

Rockwell Automation Safety PLCs

Rockwell Automation manufactures three distinct families of safety PLCs and a variety of safety I/O modules.

SmartGuard™ 600 Controllers

The SmartGuard 600 controller is designed for applications that require some complex logic. It is a "packaged safety controller" that includes the CPU, 16 Safety Inputs and 8 Safety Outputs and an embedded DeviceNet communications port all in one unit. Using the DeviceNet communications port, the SmartGuard 600 controller can control additional safety I/O modules including the 1791DS CompactBlock Guard I/O and 1732DS ArmorBlock Guard I/O, as well as 1734 POINT Guard I/O modules via a 1734-PDN module. In addition, the SmartGuard controller can also communicate with standard PLCs and HMIs on DeviceNet or EtherNet/IP networks. SmartGuard 600 systems are programmed using RSNetWorx for DeviceNet software. For more information on SmartGuard 600 controllers, see page 5-119.

GuardPLC™ Controllers

GuardPLC refers to a family of safety controllers that are programmed with the RSLogix Guard PLUS software package. Like the SmartGuard 600, the GuardPLC 1600 and GuardPLC 1800 Safety PLCs are "packaged safety controllers" with a CPU, safety I/O and embedded communication networks. In the case of the GuardPLC 1600 and 1800 the embedded communication network is Ethernet for communication to GuardPLC Safety I/O modules as well as EtherNet/IP for communications to standard controllers and HMIs. The GuardPLC 1600 includes 20 safety inputs and 8 safety outputs. The GuardPLC 1800 includes 24 safety inputs, 8 safety outputs, 8 safety analog inputs and 2 safety rated high speed counters. For more information on GuardPLC controllers, see page 5-123.

GuardLogix® Controllers

The GuardLogix system is a Logix5000™ controller that in addition to running all standard control functions like sequential, motion, etc., also has the ability to run a Safety Task and control safety I/O. This enables both safety and standard applications to run simultaneously in a single application project. This reduces integration, spare parts, training and improves the flow of data to HMI and information systems. A GuardLogix controller communicates to Guard I/O modules via standard control networks (EtherNet/IP or DeviceNet™) using the CIP Safety protocol. It is programmed with RSLogix™ 5000 software, just like a Logix5000™ processor. For more information on GuardLogix controllers, see page 5-133.

Guard I/O™ Modules

Guard I/O is the name for the Rockwell Automation family of Safety I/O modules that communicate via CIP Safety on EtherNet/IP and DeviceNet networks. CompactBlock Guard I/O modules on EtherNet/IP and DeviceNet networks are available in IP20 (in-cabinet) form-factor ArmorBlock Guard I/O modules on DeviceNet networks are available in IP67 (on-machine) form-factors. POINT Guard I/O modules provide EtherNet/IP connectivity in a maximum density in-cabinet I/O solution. For more information on Guard I/O modules, see page 5-137.

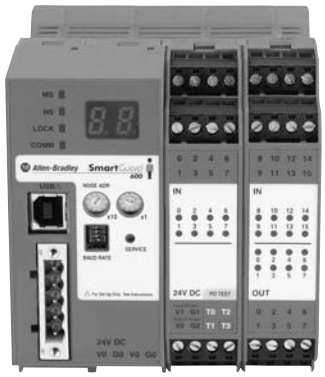
High Speed Counter	N/A	• 2 high speed counter inputs (on-board GuardPLC 1800)	N/A



Description

The SmartGuard 600 safety controller is a programmable safety controller designed for safety applications that require some complex logic allowing for more advanced safety functionality. It features 16 safety-rated inputs, 8 safety-rated outputs, 4 pulse test sources and an optional EtherNet/IP™ port. To support both standard CIP and CIP safety, a DeviceNet™ connection is also included. Configuration and programming is accomplished on EtherNet/IP, DeviceNet, or through the built-in USB port.

Since the SmartGuard 600 safety controller is a safety master on the DeviceNet network, you can use Rockwell Automation Guard I/O™ modules to expand the number of safety devices the SmartGuard 600 controller can control. It can also perform safety interlocking between a GuardLogix or other SmartGuard 600 controllers. With your choice of EtherNet/IP™ or DeviceNet™ communication, other devices such as standard PLCs and HMIs can read data out of the SmartGuard 600 controller for system-level diagnostics and troubleshooting.

Use RSNetWorx™ for DeviceNet™ software to configure the network and program the controller. From within RSNetWorx for DeviceNet software, you can launch an editor that lets you write function block programs for the SmartGuard 600 controller. No additional programming software is required. With ten safety application instructions, plus another dozen logic and timing instructions, you can write powerful, yet simple safety control programs.

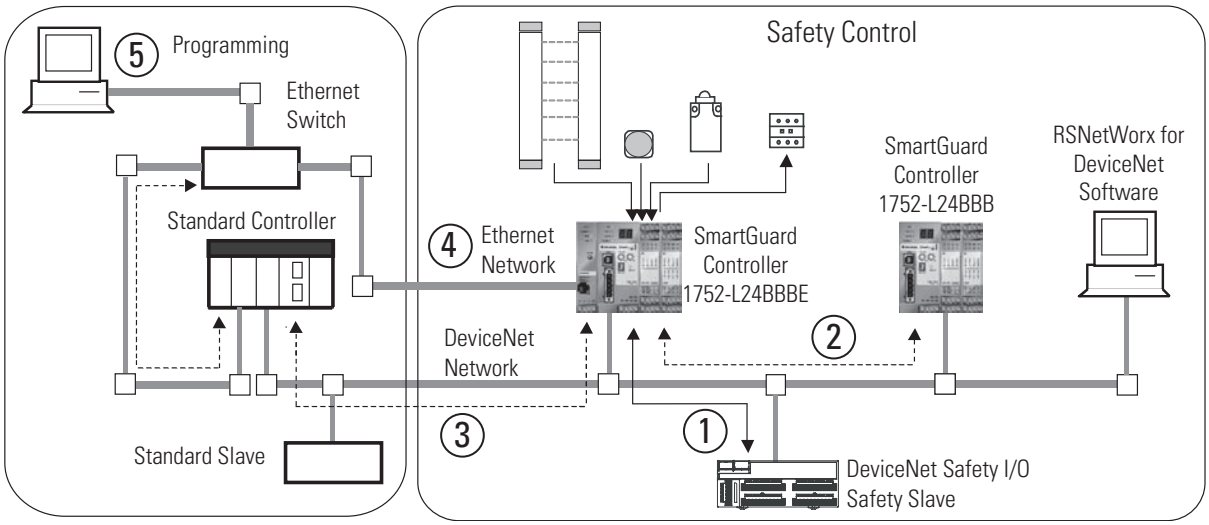
Benefits

- Small, cost-effective, intelligent safety controller
- Ideal mid-level safety controller when the application is too complex for a safety relay, yet too simple for a full-sized safety PLC
- Use the DeviceNet network to distribute safety I/O and integrate into a standard control system
- Use RSNetWorx for DeviceNet software for configuration and programming — no special programming software required

Networking with SmartGuard 600 Controllers

The SmartGuard 600 controller can function simultaneously as a DeviceNet safety master, DeviceNet safety slave, and DeviceNet standard slave as well as an EtherNet/IP target (see network illustration).

- As a DeviceNet safety master (1), the SmartGuard 600 controller can control up to 32 Guard I/O modules. These 1791DS and 1732DS modules are the same distributed safety I/O modules used with GuardLogix controllers.
- As a DeviceNet safety slave (2), the SmartGuard 600 controller looks like distributed safety I/O to a safety master. A GuardLogix or another SmartGuard safety master can read and write safety data to the SmartGuard slave controller. This lets you perform distributed safety control through the interlocking of multiple controllers via CIP Safety on DeviceNet networks.
- As a DeviceNet standard slave (3), the SmartGuard 600 controller can look like a standard distributed I/O module and respond to explicit messages so that standard DeviceNet masters like ControlLogix, SLC 500, or PLC-5 controllers or an HMI can read and write information to and from the SmartGuard 600 controller. This facilitates coordination with your standard PLC application, including displaying safety system information on an HMI.
- As an EtherNet/IP standard target (4), the SmartGuard 600 controller communicates with an Ethernet/IP standard originator, such as a CompactLogix or MicroLogix controller or an HMI device.
- As a limited EtherNet/IP bridge device (5), the SmartGuard 600 controller lets programming tools bridge to DeviceNet to view and program the SmartGuard 600 controller and configure other DeviceNet devices.



Configuration and Programming

You can program and configure the SmartGuard 600 controller through its USB port, through a DeviceNet connection or through an Ethernet connection. The SmartGuard's USB port has limited pass-through capabilities, letting you configure other devices on DeviceNet networks. You can use any type of A-to-B connection USB cable that supports USB 1.x or 2.0. Alternatively, you can connect to the SmartGuard controller through its DeviceNet port via a PCD card or a PC connected to an EtherNet/IP-to-DeviceNet linking device or gateway. You can also connect the 1752-L24BBBE SmartGuard controller to a PC's Ethernet port using a Category 5 Ethernet cable.

Safety System Management

Multiple system management tools are built into the SmartGuard 600 controller and RSNetWorx for DeviceNet software.

- You can password-protect the entire SmartGuard 600 controller so you cannot download any changes without the password. You can also password-protect the program with a separate password, to help prevent unauthorized edits to the program.
- Each safety device contains a configuration signature that changes any time the DeviceNet configuration or SmartGuard program changes, even if it is changed back to its original state. The configuration signature can be read by external devices, such as standard PLCs, HMI, or asset management software, to determine whether the configuration or program has been changed.
- Lastly, you can use the Safety Device Verification Wizard in RSNetWorx for DeviceNet software to safety-lock the SmartGuard 600 controller. Safety-locking via the Safety Device Verification Wizard verifies that the offline and online configuration and program are identical and provides documentation that you can keep in your files to show that the controller has not been tampered with.

Typical Applications

The SmartGuard 600 controller is positioned between a safety relay system and a safety PLC. It is ideally sized for applications that cannot be solved with safety relays, or are very cumbersome to solve with relays, but are not complex enough for a traditional safety PLC like a GuardLogix® or GuardPLC™ controller.

- Applications where a safety relay solution (or configurable safety relay solution) is just too complex
- Applications that require distributed safety I/O and/or network integration with a standard PLC
- Applications where GuardLogix or GuardPLC controllers seem too big (or are not cost-effective)
- Applications that require multi-zone control
- Complex light curtain applications; for example, implementing light curtain muting when a robot is not in the operator load zone and monitoring an enable pendant that lets the operator enter the zone with the robot present.

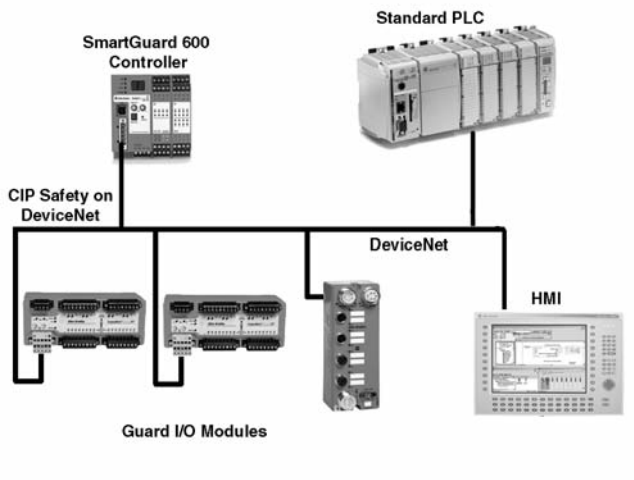
Typical SmartGuard 600 System Architectures



SmartGuard 600 controller (1752-L24BBB) on a DeviceNet network.

RSNetWorx™ for DeviceNet™ Software Description

RSNetWorx™ for DeviceNet™ software is the premier configuration software for your Open DeviceNet Vendor Association DeviceNet network; it provides configuration management and diagnostic features, and it is one of the most advanced DeviceNet network management software packages available today. RSNetWorx Software for DeviceNet Network helps you achieve maximum productivity with your DeviceNet installations.

You can quickly define the devices on your DeviceNet network and the input/output exchanges that take place through this simple software interface.

RSNetWorx for DeviceNet software supports configuration of DeviceNet Safety devices. A Safety Device Verification Wizard guides you through the verification and configuration locking process and provides a report listing the configuration information for all of the safety devices on the network.

RSNetWorx Software for DeviceNet contains the editor used to program the SmartGuard 600 controller. Once you have configured your network containing a SmartGuard 600 controller, you launch the editor, which lets you write function block programs. No additional programming software is needed!

Cat. No.	Description
9357-DNETL3	RSNetWorx for DeviceNet

Benefits

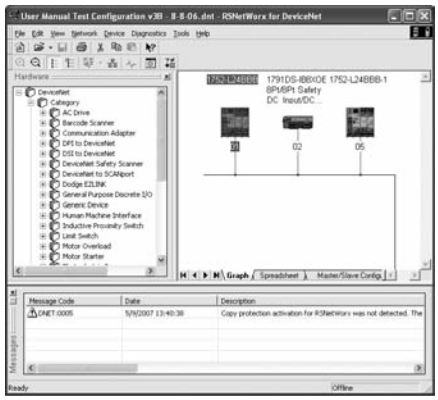
- Define the devices that are present on your network. You can either manually drag/drop devices/modules or go online to a DeviceNet network and let the software determine the devices/modules that are present.
- Define configuration settings for devices on the DeviceNet network through a convenient property page interface.
- Define the input/output information exchanges that you want to take place on the DeviceNet network.
- Access a comprehensive product tutorial to help you get the most value from the software as quickly as possible.
- Receive troubleshooting hints whenever error messages are presented, making you more productive.
- Configure and exchange data with DeviceNet Safety Scanner and DeviceNet Safety I/O nodes.
- Verify and lock safety devices for use in high-integrity safety systems.

System Requirements

RSNetWorx software can be used with these operating systems:

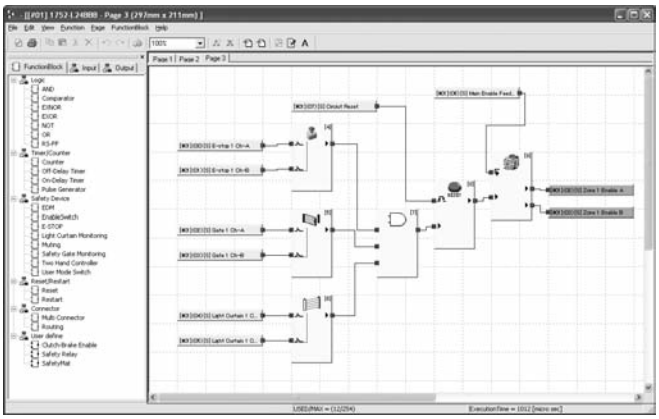
- Microsoft Windows Vista
- Microsoft Windows XP
- Microsoft Windows 2000

RSNetWorx for DeviceNet Software Examples



Use RSNetWorx for DeviceNet software to configure all of your DeviceNet devices, including SmartGuard 600 controllers and Guard I/O modules.

The Properties page for the SmartGuard 600 controller allows you to configure all of its parameters including I/O tags, I/O discrepancy times, connections to Guard I/O modules, and data that can be read by standard controllers or HMIs.



By clicking on the 'Logic' tab on the Properties dialog, RSNetWorx for DeviceNet software launches the editor for the SmartGuard 600 controller where you create your program using safety instructions, basic logic, timers, and counters. You also have the ability to create your own instructions.

Guard I/O™ Modules

When the SmartGuard 600 controller needs additional safety I/O points, you can control and monitor your safety device with Guard I/O. When used with SmartGuard controllers, Guard I/O communicates on DeviceNet using CIP Safety protocol. As a proven technology, Guard I/O detects failures at the I/O and field device level, while enhancing operator protection.

CompactBlock Guard I/O modules are available in IP20 (in-cabinet) form factor. ArmorBlock Guard I/O modules are IP67 (on-machine) form factor. POINT Guard I/O provides maximum I/O density in minimal panel space (used in conjunction with a 1734-PDN adapter on a DeviceNet network).

For more information on Guard I/O see page 5-137.

System Overview

The GuardPLC system is a state-of-the-art safety system offering fast safety PLCs, optimum controller throughput, and a reliable safety network.

The GuardPLC system meets the worldwide standard for programmable controls, complying with many of the latest global safety standards and the worldwide standard for functional safety in programmable electronic systems. The GuardPLC system can be used without restriction in applications up to Safety Integrity Level 3 (SIL 3) according to IEC 61508 and PLe/Category 4, according to ISO 13849-1.

The GuardPLC system consists of four main components:

- Packaged controller and associated integrated I/O
- Safety Communication via GuardPLC Ethernet networks
- Distributed I/O modules for GuardPLC Ethernet networks
- Programming and configuration software

Benefits

Benefits resulting from the use of safety PLCs and safety networks include:

- Greater integration and flexibility of machine controls.
- Capability for better and easier diagnostics when intelligence is provided to the standard control level
- Faster and easier maintenance
- Reduction in the cost of installation, commissioning, and reconfiguring
- Reduction in design and hardware costs, compared to using safety relays alone for logic
- Potential for throughput performance improvement in more complex systems

GuardPLC Safety Control Systems

	 GuardPLC 1600 5-125	 GuardPLC 1800 5-127	 GuardPLC Distributed I/O 5-129
Description	A cost-effective safety PLC offering a built-in 4-port Ethernet switch, digital I/O, and flexible communication options for connecting devices.	Analog inputs and high-speed counters allow the GuardPLC 1800 to sense temperature, pressure, speed, and motion.	Distributed safety I/O blocks provide exceptional flexibility in configuring the right mix of I/O in the right place.

GuardPLC™ Safety Control Systems

Overview

Communication

GuardPLC safety controllers communicate on a Safe Ethernet communications network called GuardPLC Ethernet. The network is certified by TÜV for use in safety applications up to SIL 3 and PLe/Category 4, and can be used for distributed safety I/O and peer-to-peer communications between GuardPLC controllers, as well as programming using RSLogix Guard PLUS! software. And because it's Ethernet, you use standard category 5 cables, switches and routers.

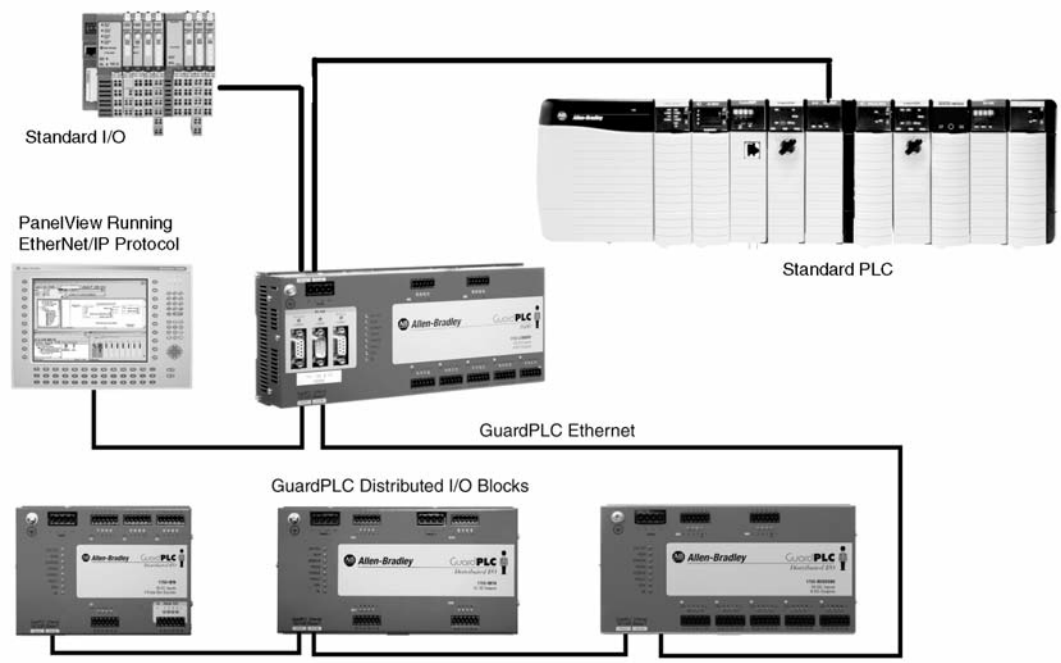
Using GuardPLC distributed I/O, you can place your safety I/O where your safety field devices are located, reducing wiring costs. Peer-to-peer communications allow GuardPLC controllers running their own programs to interlock with each other for applications that need to link one manufacturing cell to others.

NetLinx Integration

The ever-increasing demand for both enhanced plant productivity and improved workplace safety has fueled a trend toward integrated safety control and standard control systems. Control system users now expect their safety systems to possess all of the efficiencies and conveniences of their standard controls. Today's modern manufacturing plants will not accept safety systems that compromise productivity. Both machine builders and end users expect that the cost of implementing and maintaining a safety system will continue to drop without reducing the level of protection to the user.

The first level of integrating your GuardPLC controller into your standard control system is at the information network level. The GuardPLC 1600 and 1800 controllers let you to accomplish this easily with embedded EtherNet/IP protocol. Able to run EtherNet/IP protocol at the same time as safety-rated GuardPLC Ethernet protocol, the GuardPLC controller uses EtherNet/IP protocol to communicate status about the safety control system to other standard devices such as PLCs (ControlLogix®, FlexLogix™, CompactLogix™, SLC™ 500 or PLC-5®), HMIs (PanelView™, PanelView Plus, VersaView®) and others. The GuardPLC controller can even control standard I/O, like Flex I/O and Point I/O, on an EtherNet/IP network. This capability lets you integrate your GuardPLC on the EtherNet/IP network already running in your plant.

GuardPLC Typical Configuration



GuardPLC 1600 Controller

The GuardPLC 1600 controller is a mainstream, cost-effective safety PLC that provides onboard digital I/O, a built-in 4-port Ethernet switch, and flexible communication options for connection to HMIs and to standard PLCs.

Benefits

- 28 safety digital I/O points – designed specifically for interfacing with safety components such as e-stops, light curtains, etc.
- Embedded 4-port Ethernet switch – eliminates the need for external networking hardware, reducing system cost.
- EtherNet/IP for easy integration with standard PLCs and HMIs.
- Modbus RTU slave and PROFIBUS DP slave communication options – allow the controller to connect to standard PLCs and HMI devices, and an RS-485 port is available for ASCII communication (read only).
- Expandability – use GuardPLC Distributed I/O to cost-effectively expand your safety system.
- Removable terminal blocks – make swapping controllers an efficient task so operations can be up and running again quickly in the event of a failure.

Typical Applications

- Perimeter guarding for robot / weld cells
- Perimeter guarding for packaging machines
- Press controls
- Semiconductor tools
- Material handling systems

Product Design

The GuardPLC 1600 controller features a built-in four-port Ethernet switch and digital I/O (20 safety rated inputs and eight safety rated outputs). 100M GuardPLC Ethernet comes standard, plus for flexibility in connecting to HMI devices and standard PLCs, the controller includes EtherNet/IP, Modbus RTU Slave or PROFIBUS DP Slave, an RS-485 port for ASCII communications.

At 10 ms throughput, this controller is one of the fastest safety PLCs in the industry. Its exceptionally high mean time between failures helps increase the safety and reliability of your system. Removable terminal blocks make swapping controllers a quick task so operations can be up and running again quickly in the event of failure.

Features

- 28 digital I/O points: 20 inputs, 8 outputs
- Use GuardPLC Distributed I/O to expand safety system
- EtherNet/IP, RS-485 port for ASCII communication (read only)
- Embedded 4-port Ethernet switch eliminates the need for external networking hardware
- Modbus RTU slave and PROFIBUS DP slave communication options to connect to standard PLCs and HMI devices
- Certified by TÜV for use in applications to SIL 3 according to IEC 61508 and PLe/Category 4, according to ISO 13849-1
- Programmed with RSLogix Guard PLUS! Software
- DIN rail mounting
- Cost-effective safety control system

Specifications

General Specifications

The following specifications are common to all GuardPLC products unless indicated.

Temperature, operating	0…60 °C (32…140 °F)
Temperature, nonoperating	-40…85 °C (-40…185 °F) without backup battery
Relative Humidity	95%
Vibration	1 g @ 10…150 Hz
Shock, operating	15 g

Certifications

(When product is marked.)

Certifications	GuardPLC 1600, GuardPLC 1800, and 1753 I/O
c-UL-us	c-UL Listed Industrial Control Equipment.
CE	Compliant for all applicable directives.
C-Tick	C-Tick compliant with all applicable acts
Functional Safety	certified by TÜV up to SIL 3, and PLe/Cat. 4

GuardPLC 1600 Controller Specifications

Cat. No.	1753-L28BBBM	1753-L28BBBP

❄ Not electrically isolated.
‡ Height includes latch; width includes housing screws; depth includes grounding bolt and connectors.

GuardPLC 1800 Controller

The GuardPLC 1800 controller takes all the features of the GuardPLC 1600 controller, then adds analog inputs and high-speed counters for specialized applications such as emergency shut down, flame control, and amusement park ride control.

Benefits

- 32 safety digital I/O points – designed specifically for interfacing with safety components such as e-stops and light curtains.
- 8 safety-rated analog inputs – for sensing temperature, pressure, etc.
- 2 safety-rated high-speed counters – for sensing speed, flow, and motion.
- Embedded 4-port Ethernet switch – eliminates the need for external networking hardware.
- Supports EtherNet/IP protocol for easy integration with standard PLCs and HMIs.
- Modbus RTU slave and PROFIBUS DP slave communication options – lets the controller connect to standard PLCs and HMI devices, and an RS-485 port is available for ASCII communication (read only).
- Expandability – Use GuardPLC Distributed I/O to expand your safety system.
- Removable terminal blocks – make swapping controllers an efficient task so operations can be up and running again quickly in the event of a failure.

Typical Applications

- Emergency shutdown
- Burner management systems
- Perimeter guarding for robot / weld cells
- Perimeter guarding for packaging machines

Product Design

The GuardPLC 1800 controller has the same features as the GuardPLC 1600 controller with additional I/O, including analog I/O and high-speed counters for specialty applications. Built-in I/O includes 24 digital inputs, 8 digital outputs, 8 analog inputs, plus 2 high-speed counters. With GuardPLC distributed I/O you can place additional safety I/O where your safety field devices are located, reducing wiring costs.

The GuardPLC 1800 offers a built-in four-port Ethernet switch and 100M GuardPLC Ethernet comes standard. For flexibility in connecting to HMI devices and standard PLCs, the controller includes EtherNet/IP, Modbus RTU Slave or PROFIBUS DP Slave, an RS-485 port for ASCII communications.

At 10 ms throughput, this controller is one of the fastest safety PLCs in the industry. Its exceptionally high mean time between failures helps increase the safety and reliability of your system. Removable terminal blocks make swapping controllers a quick task so operations can be up and running again quickly in the event of failure.

Features

- 32 digital I/O points: 24 inputs, 8 outputs

Distributed Safety I/O for GuardPLC Ethernet

Take advantage of all the benefits of traditional distributed I/O with GuardPLC distributed safety I/O, available for all GuardPLC systems.

GuardPLC distributed I/O modules provide considerable flexibility in configuring the right mix of I/O in the right place. The 16 digital input module offers 4 pulse test source terminals, allowing users to pulse test all 16 digital inputs from the I/O module and providing PLe/Category 4 capable safety circuitry while retaining all the advantages of distributed I/O. The 16 digital output module is rated for 2A on every other output point, limiting the need for additional interposing safety relays for additional current and therefore saving on machine costs.

The safety relay output module can provide dry contact enable signals as well as high current AC or DC outputs. The 8 input/8 output and 16 input/8 output digital combination modules feature both positive and negative switching outputs, for applications that use diverse outputs. The analog input module lets you distribute analog inputs for more process-oriented safety applications.

All I/O modules include GuardPLC 100 Mbps Ethernet, which provides one of the fastest safety networks and machine stop times in the industry. The built-in two-port Ethernet switches make connecting I/O modules to the GuardPLC controller as easy as daisy-chaining Ethernet cable from I/O module to controller.

Benefits

- Place the I/O where the devices reside.
- Reduce wiring costs and the time necessary to wire the machine or cell.
- Reduce machine or cell start up time.
- Increase machine and cell reliability.

RSLogix Guard PLUS! Programming Software

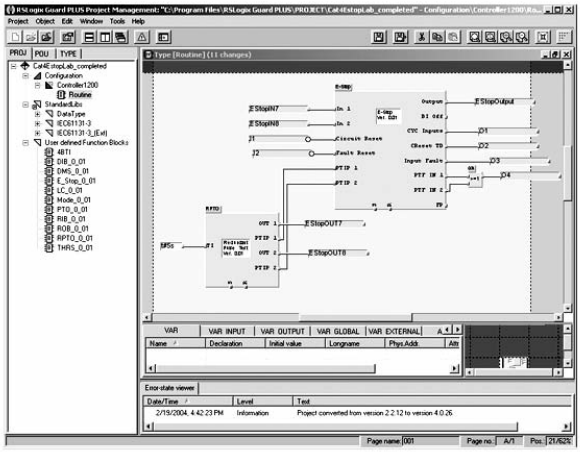
Development and testing of programs for all GuardPLC systems is done with RSLogix Guard PLUS! programming software, an easy to use yet highly powerful programming software. RSLogix Guard PLUS! software is project-based, meaning you can store programs for multiple controllers in one project.

RSLogix Guard PLUS! is based on graphical function blocks. Simply design your logic using pre-defined elements such as AND-gates, OR-gates, numerical functions, etc., then connect inputs and outputs using the mouse.
RSLogix Guard PLUS! software offers unlimited data tags, program pages, and function blocks for maximum flexibility.

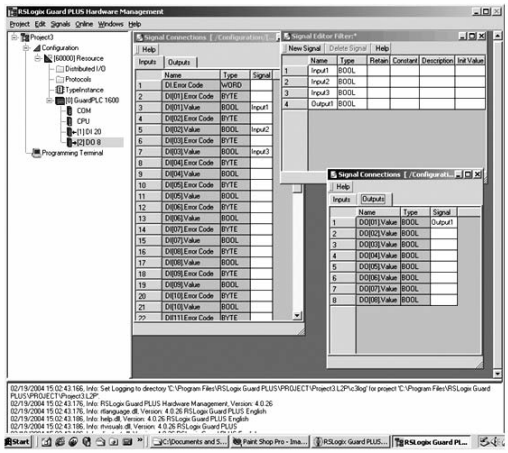
Once RSLogix Guard PLUS! software has been configured for the chosen controller, input and output variables are defined in a tag list to establish the link between hardware and software in a manner similar to that used by ControlLogix controllers and RSLogix 5000 programming software.

To save time and decrease development effort, the offline program simulation allows you to test your program without downloading it to a GuardPLC controller. Online program monitoring allows you to view your logic inside the controller to see which parts are logically true and false and to troubleshoot as necessary.

RSLogix Guard PLUS! Programming Software Examples



Use the project management screen to write a program, perform offline program simulation, and view the program running online.



The hardware management screen within RSLogix Guard PLUS! lets you configure the hardware of your GuardPLC system, create tags, and then drag them into your program.

Benefits

- Ease of use – program your safety control system using pre-defined graphical elements and a "drag and drop" palette.
- Tag-based system – define program variables to suit specific application and use variable names.
- Offline program simulation – test your program without using the controller.
- Online program monitoring – eases troubleshooting by viewing logic inside of GuardPLC controllers.
- Unlimited program pages and unlimited variables – configure program to suit specific needs.
- User-defined function blocks with library function – create your own specific instructions.
- Project-based controller linkage – store programs from multiple controllers in one project; ideal for cells that contain multiple GuardPLC controllers.
- Safety certified function blocks – save programming and configuration time by using function blocks that are already certified for use in safety applications.

System Requirements

Requirements to install RSLogix Guard PLUS! programming software on a personal computer.

Requirements	Minimum	Recommended
Personal Computer	Pentium III, 500 MHz	Pentium IV, 1.2 GHz
Operating System	Windows NT/2000	Windows NT/2000/XP
RAM	256 MB	512 MB
Free Hard Disk Space	at least 200 MB plus space for user programs	at least 200 MB plus space for user programs
Resolution	1024 x 768/256 colors	1280 x 1024/true color

GuardPLC™ Safety Control Systems

RXLogix Guard PLUS! Programming Software/GuardPLC Hand-held Terminal

RSLogix Guard PLUS! Programming Software

You can install RSLogix Guard PLUS! programming software on a local drive only (not a network).

Cat. No.	Description
1753-PCS-USB	RSLogix Guard PLUS! for all GuardPLC controllers. USB hardlock.
1753-PCS-PAR	RSLogix Guard PLUS! for all GuardPLC controllers. Parallel port hardlock.

Certified Function Blocks for RSLogix Guard PLUS!

GuardPLC Certified Function Blocks are additional, application-specific instructions that can be used in your GuardPLC controller's application program. Certified by TÜV, these function blocks make application development, debugging, and troubleshooting quicker and easier. Certified Function Blocks are sold in suites or libraries that contain several blocks for specific applications.

Cat. No.	Description
1753-CFBBASIC	Basic Suite of Certified Function Blocks. Includes: E-stop. Diverse Input, Light Curtain, Two-hand Run Station, Enable Pendant, Redundant Output, and Pulse Test Output.

GuardPLC OPC Server Software

GuardPLC OPC Server software allows a Windows-based PC to read data from and write data to the GuardPLC controller across the GuardPLC Ethernet network. For example, a VersaView computer could be running the GuardPLC OPC server and RSView software, then could display status information from the GuardPLC controller, such as which e-stop has been pressed, which gate is open, or which light curtain has been interrupted.

Cat. No.	Description
1753-OPC	GuardPLC OPC Server software

GuardPLC Hand-held Terminal

The GuardPLC Hand-held Terminal is a maintenance tool that lets you commission new GuardPLC controllers and Distributed I/O modules by downloading configuration data and the application program. Store all of the programs for a project on a multimedia memory card, and connect to any GuardPLC device on the Ethernet network. The hand-held terminal is ideal for a downtime event that requires quick replacement of a GuardPLC controller or DIO block, helping to get production up and running again.

1753-HHT Specifications

Operating Voltage Range	2.4…3.0V DC
Current Consumption	Approximately 360 mA (display illumination off) Approximately 560 mA (display illumination max)
Batteries	2 AA rechargeable batteries NiMH 2000 mAh or standard batteries
Operating Time, Min. with NiMH 2000 mAh batteries	Approximately 3 hours
Battery Charger, Supply Voltage	12V
Battery Charger, Current Input	≤ 0.83 A
Battery Charger, Charging Current	Approximately 1 A
Battery Charger, Trickle Charge	25 mA
Temperature, operating	5…55 °C (41…131 °F)
Temperature, nonoperating	-40…70 °C (-40…158 °F)
Relative Humidity	5…90% noncondensing
Vibration	5 g @ 10…500 Hz
Shock, operating	15 g
Dimensions (HxWxD), Metric	16.5 x 9 x 3 cm
Dimensions (HxWxD), Imperial	6.5 x 3.4 x 1.2 in
Weight, Metric	300 g
Weight, Imperial	0.66 lb

GuardLogix Integrated Safety System Overview

A GuardLogix® controller is a full-function Logix processor that also provides safety control. The GuardLogix system is a dual processor solution that uses a primary controller and a safety partner to achieve SIL 3, PLe. A major benefit of this system is that it is a single project, with safety and standard control together. The GuardLogix system is a 1oo2 safety architecture that provides unmatched safety and ease of use.

Just like other Logix processors during development, safety and standard have the same rules. Online editing, forcing, even multiple users are all allowed. Once the project is tested and ready for final validation, you set the Safety Task to a SIL 3 integrity level, which is then enforced by the GuardLogix controller. When safety memory is locked and protected, the safety logic cannot be modified. On the standard side of the GuardLogix controller, all functions operate like a regular Logix controller, motion, drive, sequential, even process. Thus, online editing, forcing, and other activities are all allowed, while safety is securely isolated.

With this level of integration, safety memory can be read by standard logic and external devices, such as HMIs or other controllers, eliminating the need to condition safety memory for use elsewhere. The result is easy, system-wide integration and the ability to display safety status on displays or marquees. Use Guard I/O modules for field device connectivity on Ethernet or DeviceNet networks. For safety interlocking between GuardLogix controllers, use Ethernet or ControlNet networks. Multiple GuardLogix controllers can share safety data for zone-to-zone interlocking, or a single GuardLogix controller can use remote distributed safety I/O between different cells/areas.

Environmentals and Certifications

∗ 1768 Compact GuardLogix controller specification and certification listings are preliminary.

GuardLogix Controllers Certifications

Certifications: UL, c-UL-us, CE, CSA, C-Tick, FM, ATEX, certified by TÜV for Functional Safety.

When product is marked. See the Product Certification link at www.ab.com/certification/ce to Declarations of Conformity, Certificates, and other certification details. For safety and SIL certification details, see www.rockwellautomation.com/products/certification/safety/index.html.

GuardLogix Controllers

Cat. No.	Description	User Memory		Module Expansion Capacity‡
		Standard Tasks and Components	Safety Task and Components	
1756-L61S	GuardLogix safety controller	2 MB	1 MB	Not applicable
1756-L62S		4 MB	1 MB	
1756-L63S		8 MB	3.75 MB	
1756-LSP	GuardLogix safety partner∗	—	—	
1768-L43S	Compact GuardLogix safety controller	2 MB	0.5 MB	1768 Modules: 2 1769 Modules: 16
1768-L45S		3 MB	1 MB	1768 Modules: 4 1769 Modules: 30

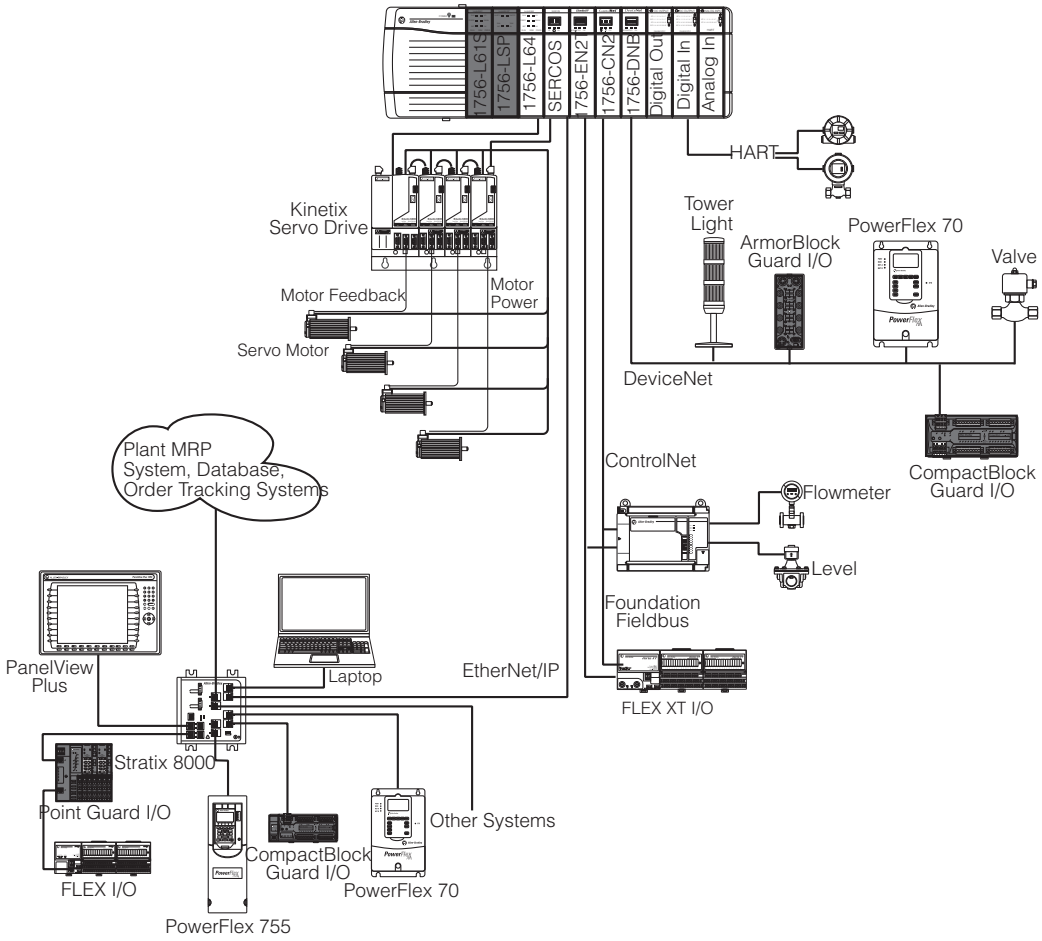
∗ A safety partner is required for each 1756 GuardLogix controller.
‡ You can install any combination of motion and network modules in a 1768 system. A maximum of two network modules may be installed in a 1768 system.

Features

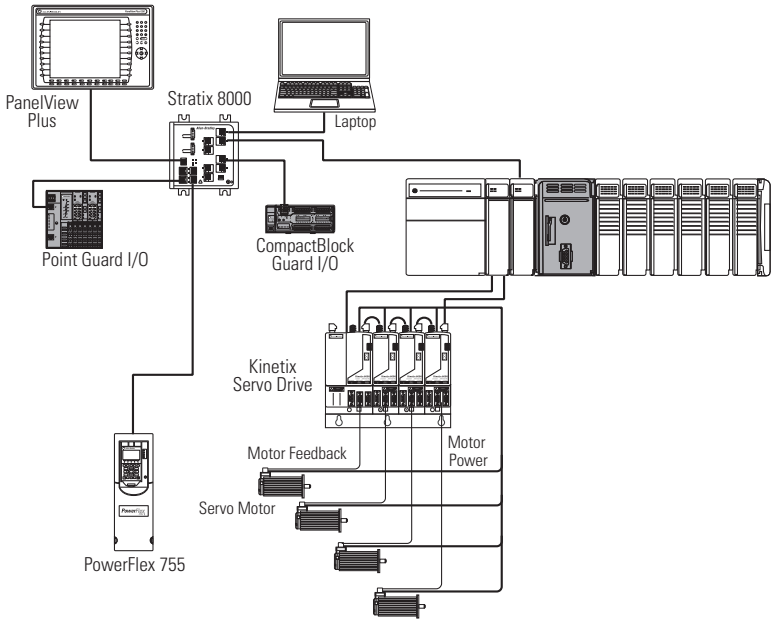
In addition to the standard features of a Logix controller, GuardLogix controllers have these safety-related features.

Feature	1756-L61S, 1756-L62S, 1756-L63S, 1756-LSP	1768-L43S, 1768-L45S	
Communication options	Standard and safety • EtherNet/IP • ControlNet • DeviceNet	Standard • EtherNet/IP • ControlNet • DeviceNet	Safety • EtherNet/IP • ControlNet
Network connections, per network module	• 256 EtherNet/IP; 128 TCP (1756-EN2x) • 128 EtherNet/IP; 64 TCP (1756-ENBT) • 100 ControlNet (1756-CN2/A) • 40 ControlNet (1756-CNB)	• 128 EtherNet/IP; 64 TCP (1768-ENBT) • 48 ControlNet (1768-CNB)	
Controller redundancy	Not supported		
Programming languages	Standard control—all languages Safety control—relay ladder		

Example Configuration—1756 GuardLogix System



Example Configuration—1768 Compact GuardLogix System



Standard Components in a GuardLogix System

Virtually all standard components are approved for use in GuardLogix safety systems. For specific series or version supported, see www.rockwellautomation.com/products/certification/safety/index.html.

For control that is not SIL 3 related, other 1756 series I/O modules can be used with 1756 GuardLogix controllers and 1768 or 1769 I/O modules can be used with 1768 Compact GuardLogix controllers. These modules must be certified to the Low Voltage and EMC Directives. Refer to www.ab.com/certification/ce to find the certificate for the Programmable Control – ControlLogix or CompactLogix Product Families.

Accessories

Replacement Batteries

	1756-BA2
Description	Lithium battery (0.59 g)
GuardLogix controllers	1756-L61S, 1756-L62S, 1756-L63S

Industrial CompactFlash Cards

CompactFlash cards offer nonvolatile memory (flash) to permanently store a user program and tag data on a controller. You install the 1784 CompactFlash card in a socket on the controller. You can manually trigger the controller to save to or load from nonvolatile memory or configure the controller to load from nonvolatile memory on power up.

1756 and 1768 GuardLogix controllers support user program storage or retrieval by using a CompactFlash card with version 18 or later of RSLogix 5000 software.

	1784-CF64	1784-CF128
Memory	64 MB	128 MB
Weight, approx.	14.2 g (0.5 oz)	

Software

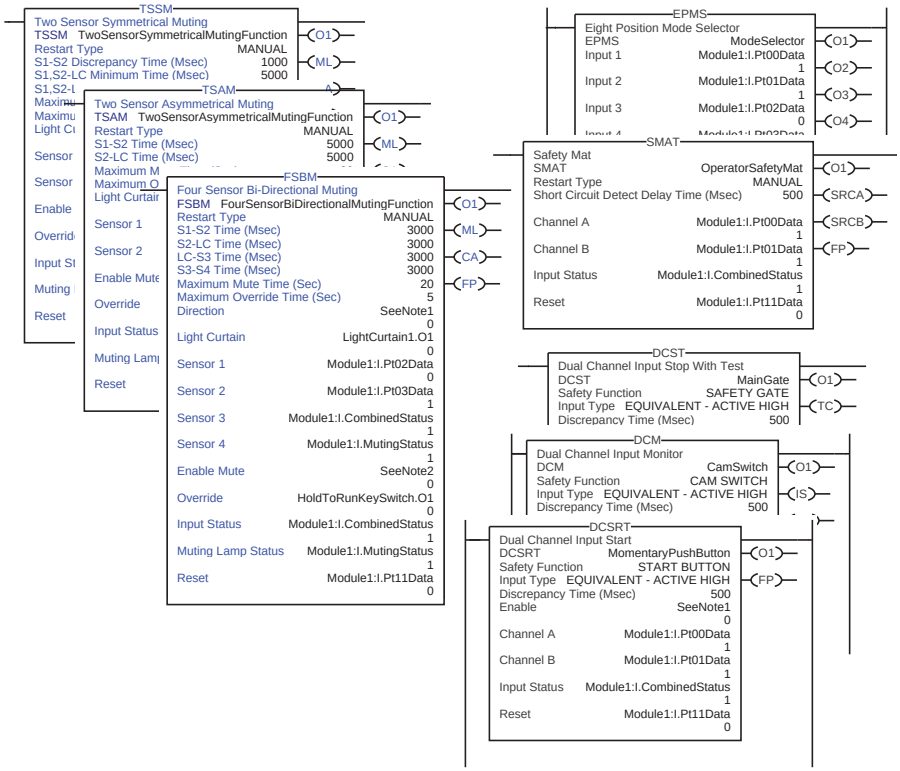
GuardLogix controllers use RSLogix™ 5000 programming software, the standard development environment for all Allen-Bradley Logix controllers. RSLogix 5000 software manages safety, so you don't have to manually manage the separation of standard and safety memory, or worry about partitioning logic to isolate safety.

FactoryTalk Suite from Rockwell Software extends the Rockwell Automation Integrated Architecture™ by providing an information tier of software applications and services for production and performance management. Tight integration with the Rockwell Automation Logix control platform, as well as connectivity to third-party and legacy systems can help deliver a seamless flow of high-fidelity data across your enterprise.

Safety-certified Instructions in RSLogix 5000 Software

All instructions available for use within the safety task are certified safety instructions. Choose from standard relay ladder safety instructions and safety application instructions, including:

- 49 safety-certified instructions
  - Subset of standard ladder logic instruction set
- Safety-certified application instructions
  - Dual channel suite - 6 instructions
  - Metalforming suite - 10 instructions
  - Muting suite - 3 instructions
  - Safety mat



Safety application instructions provide unmatched ease of use for complex safety functions like muting, safety gate control, metalforming, and more.

Guard I/O™ Modules

Overview

Guard I/O™ Modules Overview

Control and monitor your safety devices with Guard I/O. When used with Rockwell Automation safety controllers, Guard I/O communicates on EtherNet/IP or DeviceNet using CIP Safety protocol. As an effective technology, Guard I/O detects failures at the I/O and field device level, while helping enhance operator protection.

CompactBlock Guard I/O modules are available in IP20 (in-cabinet) form factor. ArmorBlock Guard I/O modules are IP64, IP65, or IP67 (on-machine) form factor (as marked on the product label) . POINT Guard I/O provides maximum I/O density in minimal panel space.

Guard I/O modules offer the following advantages when implementing a safety control system:

- **Reduced engineering** — Onboard, Guard I/O has self-diagnostics, hardware testing, and field circuit testing (short-circuit, wire break, discrepancy) with no additional programming required.
- **Cost-reduced hardware options** — Helps increase ability to safely shutdown an application without additional safety relays.
- **Space-savings** — Monitor and control more safety devices using less panel space.
- **Use of existing network infrastructures** — Connect to standard and safety I/O over one DeviceNet or EtherNet/IP network.
- **Flexibility and easy migration to EtherNet/IP** — The same Guard I/O modules for both DeviceNet and EtherNet/IP networks lets you re-use engineering designs.
- **High safety level** — certified by TÜV for Functional Safety up to SIL 3 and PLe/Category 4.

Common Guard I/O Module features:

- Integrated pulse test outputs for testing safety circuitry like e-stops and gate switches, for use in applications up to Performance Level e/Category 4. These outputs can also be used independently for standard output control or voltage source to sensors.
- Safety outputs, with integrated pulse testing for use in applications up to PLe, Cat.4.
- Ability to detect at each I/O point:
  - short-circuit to 24V DC or 0V
  - wire breakage
  - discrepancy of dual channel circuitry, due to mechanical alignment or a failure
- All Guard I/O modules have common circuit functionality, operation, programming, troubleshooting, and diagnostics.
- Built in diagnostic LEDs for I/O circuitry and power status.
- I/O point status available to any controller.
- EDS file or Logix 5000 profile compatible.
- Removable and keyed terminal blocks.
- Common power and I/O wiring across Guard I/O modules on DeviceNet and EtherNet/IP networks (1791DS-IB16/1791ES-IB16 and 1791DS-IB8XOBV4/1791ES-IB8XOBV4).
- Safety input power source separate from safety output power source.
- Removable and insertable under power, when following appropriate safety practices.
- Electronic overcurrent protection of all outputs.

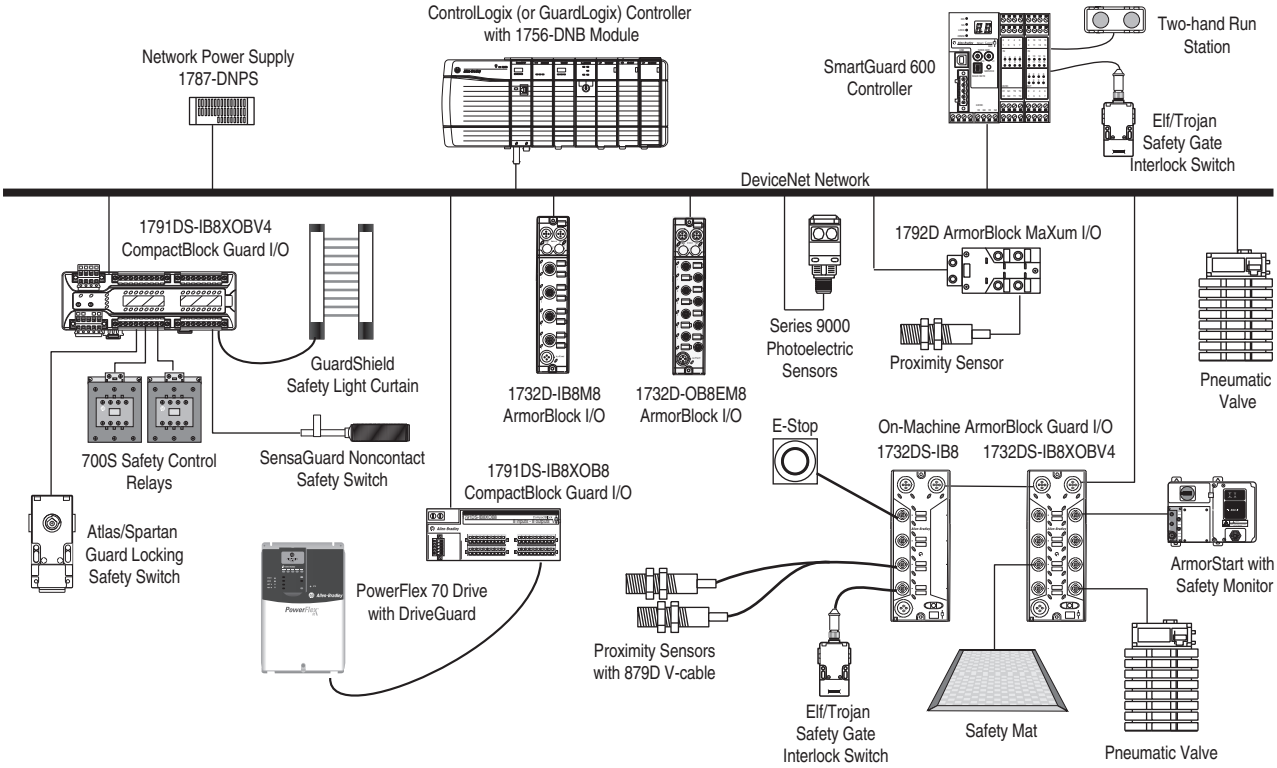
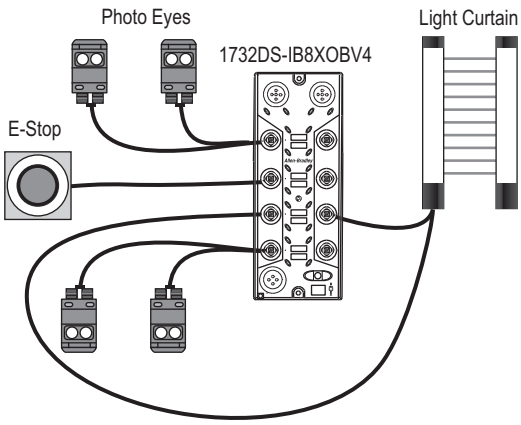
Typical Configurations

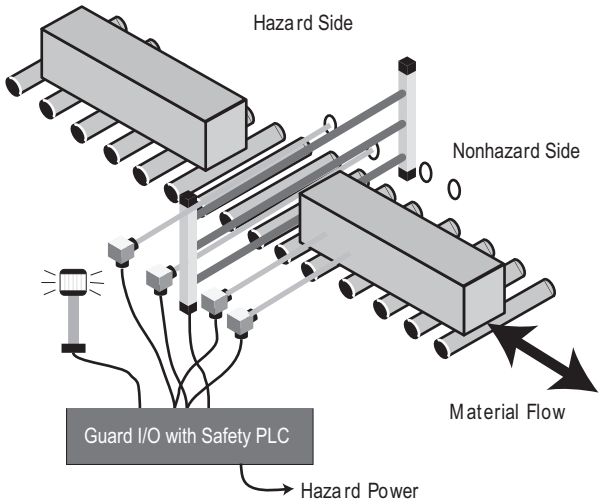


The above example network shows how almost any 24V DC safety-rated or standard sensor can be wired to any Guard I/O module to monitor the machine's status.

Choosing Your I/O Hardware

Guard I/O module options are available to minimize associated safety hardware. Additionally, installation costs, wiring time, and commissioning time can be further reduced when using ArmorBlock Guard I/O, as shown in the example below with a light curtain muting application.





A variety of CompactBlock Guard I/O is available to suit most every need.

- **1791DS-IB8XOB8 Module.** This module has up to 8 single channel safety inputs and 8 single channel safety outputs. It is often the universally chosen Guard I/O hardware for almost every application. Whether you need single or dual channel safety input or safety output circuits, the 1791DS–IB8XOB8 module is a good choice.
- **1791DS-IB4XOW4 Module.** This module has up to 4 single channel safety inputs and 4 single channel (replaceable) safety relay outputs. This module is often chosen for AC actuators or specialty safety interface applications. Whether you need single or dual-channel safety input or safety output circuits, the 1791DS-IB4XOW4 module is a good choice.
- **1791DS-IB8XOBV4 or 1791ES-IB8XOBV4 Modules.** These modules have up to 8 single channel safety inputs and 4 dual channel sink/source safety outputs, also know as bipolar or two-pole switching. They are often chosen for safety actuators that require more than 0.5 amps. For example, the control of press safety valves or control of the solenoid on a guard-locking switch like the Atlas or Trojan safety products. Whether you need single or dual channel safety input circuits and dual channel safety outputs, the 1791DS-IB8XOBV4 or 1791ES-IB8XOBV4 module will suit most any application.
- **1791DS-IB16 or 1791ES-IB16 Modules.** These modules have up to 16 single channel safety inputs. They are the universal choice of Guard I/O hardware when an application calls for the monitoring of many safety devices in one central location. When your safety application requires 2 safety mats, 2 run stations with 2 e-stops, or any similar configuration, these modules are an excellent and economical choice for every programmable safety system.

CompactBlock™ Guard I/O™

Description

CompactBlock Guard I/O provides all the advantages of traditional distributed I/O for safety systems. Distributed safety I/O reduces wiring costs and startup time for machines and cells, as compared to in-chassis I/O. You can use Guard I/O with any safety controller that communicates on DeviceNet or EtherNet/IP networks using CIP Safety, for the control and monitoring of safety circuits. Guard I/O detects circuit failures at each I/O point while providing detailed diagnostics directly to the controller. With CIP Safety you can easily integrate safety and standard control systems by using safety and standard messages on the same wire.

Several Guard I/O blocks are available with a variety of features:

- The 1791DS CompactBlock Guard I/O family consists of 24V DC digital I/O modules that communicate on DeviceNet networks.
- The 1791ES CompactBlock Guard I/O family consists of 24V DC digital I/O modules that communicate on EtherNet/IP networks.

Benefits

- TÜV Certified as a system with GuardLogix, GuardPLC 1600 and 1800, and SmartGuard 600 controllers
- Supports both standard and safety control
- I/O point-level and other detailed fault diagnostics are available to the PLC or HMI, with the self testing inputs and outputs
- EDS (RSNetWorx for DeviceNet) or RSLogix 5000 profile configuration
- Certified by TÜV for Functional Safety up to SIL 3 according to IEC 61508, and Category 4, PLe according to ISO 13849-1
- Supports single and dual channel devices on inputs and outputs
- Additional standard solid-state outputs that can be configured as pulse test sources, outputs for standard PLC control, 24V DC sources, or for muting lamp control and monitoring
- DIN Rail mounting for easy installation
- Compatible with Guardmaster and similar safety devices

ArmorBlock® Guard I/O™

Description

ArmorBlock® Guard I/O™ provides all the advantages of traditional distributed I/O for safety systems, but has an IP64, IP65, or IP67 package (as marked on the product label) that can be mounted directly on your machine. On-machine safety I/O reduces wiring time and startup costs for safety controller applications by eliminating electrical boxes and simplifying cable installation. The ArmorBlock family provides industrially hardened I/O blocks that you can mount directly on equipment near sensors or actuators. Wiring the I/O to the sensors and actuators is easy using pre-wired quick disconnect cables.

You can use Guard I/O with any safety controller that communicates on DeviceNet using CIP Safety for the control and monitoring of safety circuits. Guard I/O detects circuit failures at each I/O point while providing detailed diagnostics directly to the controller. With CIP Safety, you can easily integrate safety and standard control systems by using safety and standard messages on the same wire.

The 1732DS ArmorBlock Guard I/O family consists of 24V dc digital I/O modules that communicate on DeviceNet networks. The I/O connectors are sealed M12 micro style while the network and auxiliary power connectors are sealed mini style. Plus, the ArmorBlock Guard I/O uses the same input and output M12 pin configuration as standard ArmorBlock and Maxum.

Benefits

- IP64, IP65, or IP67 rated for direct mounting on machine without an enclosure (rating is marked on the product label)
- Compact footprint
- Quick disconnect dual-channel M12 I/O connectors allow a single cable connected between ArmorBlock Guard I/O and a dual-channel safety device (See the following table of Allen-Bradley Guardmaster safety devices)
- TÜV certified as a system with GuardLogix, GuardPLC1600/1800, SmartGuard 600 controllers
- Supports both standard and safety control
- Supports single and dual-channel devices on inputs and outputs
- I/O point-level and other detailed fault diagnostics are available to the PLC or HMI with self-testing inputs and outputs
- EDS (RSNetWorx for DeviceNet) or RSLogix 5000 profile configuration
- Certified by TÜV and UL for Functional Safety up to SIL 3 according to IEC 61508, and PLe/Category 4, according to ISO 13849-1
- Additional standard solid-state outputs can be configured as pulse test sources, outputs for standard PLC control, 24V dc sources, or muting lamp control and monitoring

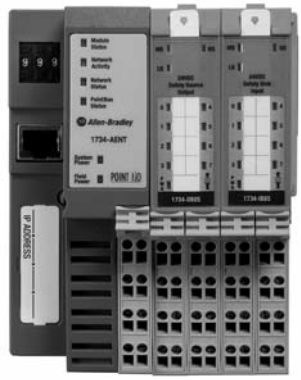
POINT Guard I/O™



Description

POINT Guard I/O™ modules are safety-rated I/O modules designed to fit into the standard POINT I/O system, offering automation and safety functionality in a maximum density I/O solution. They are ideal for use is applications requiring safety and automation control. They communicate by using CIP Safety protocol over EtherNet/IP for GuardLogix controllers or DeviceNet for SmartGuard safety controllers. The application of CIP Safety protocol allows simultaneous transmission of safety and automation control and diagnostic data over one CIP network.

POINT Guard I/O and POINT I/O can be controlled by one GuardLogix controller for both safety and automation control through one node. If separate safety control is required, a GuardLogix controller can be used with POINT Guard I/O for safety control and a ControlLogix controller can be used with POINT I/O for automation control. No changes are required to the POINT I/O system.

This solution is ideal for applications requiring maximum I/O density in minimum panel space. The advanced solid-state design allows for module replacement in minutes and helps reduce the need for special maintenance or training.

POINT Guard I/O is designed for use with industrial equipment and is especially suited for robotic, point-of-operation, guard-monitoring, and distributed control applications.

Benefits

- Mix safety inputs and outputs with standard POINT I/O, all with one node
- Maximum I/O density in minimum panel space
- Simple to add to existing panels using POINT I/O
- I/O point-level diagnostics quickly identify problems and reduce downtime
- Easy configuration by using RSLogix 5000 with full support of IP addressing
- Optimize installations by assigning individual test output for safety input device
- Connect single and dual-channel safety devices on inputs and outputs
- Certified by TÜV for Functional Safety up to SIL 3 according to IEC 61508, and PLe/Category 4, according to ISO 13849-1
- Muting lamp control and monitoring on selected test pulse outputs

Networking with POINT Guard I/O™

POINT Guard I/O™ modules are used in the POINT I/O platform and can communicate safety messages via network adapters to connect to EtherNet/IP or DeviceNet networks. Use these adapters for network communication.

Network	System	Adapter✶
EtherNet/IP	GuardLogix	1734-AENT
		1734-AENTR
DeviceNet	SmartGuard 600	1734-PDN

✶ Not compatible with 1734-ADN, 1734-ADNX, 1734-AP, or 1734-ACNR adapters.

Bulletin 280D/281D

280D/281D ArmorStart Distributed Motor Controller — Safety Version

Description

The Bulletin 280/281 ArmorStart Distributed Motor Controller is an integrated, pre-engineered, starter for full-voltage and reversing applications. The ArmorStart offers a robust IP67/NEMA Type 4 enclosure design, which is suitable for water wash-down environments. The modular plug-and-play design offers simplicity in wiring the installation. The quick disconnects for the I/O, communications, and motor connection reduce the wiring time and eliminate wiring errors. The ArmorStart offers as standard, four DC inputs and two relay outputs to be used with sensors and actuators respectively, for monitoring and controlling the application process. The ArmorStart's LED status indication and built-in diagnostics capabilities allows ease of maintenance and troubleshooting. The optional Hand/Off/Auto (HOA) keypad allows for local start/stop control at the ArmorStart Distributed Motor Controller.

The Bulletin 280/281 ArmorStart Distributed Motor Controller offers short-circuit protection per UL 508 and IEC 60947. The ArmorStart is rated for local-disconnect service by incorporating the Bulletin 140 Motor Protector as the local-disconnect, eliminating the need for additional components. The ArmorStart Distributed Motor Controllers are suitable for group motor installations.

Safety ArmorStart

The safety version of the ArmorStart provides a safety solution integrated into DeviceNet Safety installations. The Bulletin 280/281 Safety ArmorStart achieves Category 4 functionality by using redundant contactors. The Safety ArmorStart offers a quick connects via the gland plate to the 1732DS-IB8XOBV4 safety I/O module. The Bulletin 1732DS Safety I/O inputs will monitor the status of the safety rated contactors inside the ArmorStart. The Bulletin 1732DS Safety I/O outputs to provide 24V DC power for control power to the ArmorStart.

Note: The Bulletin 280/281 Safety ArmorStart is suitable for safety applications up to Safety Category 4 PLe (TÜV assessment per ISO 13849-1:2008). TÜV compliance letter is available upon request.

Note: For additional information regarding the 1732DS-IB8XOBV4 safety I/O module, see publication 1791DS-UM001*-EN-P.

Features

- On-Machine™ starting solution
- Full-voltage and reversing
- Horsepower range 0.5…10 Hp (0.37…7.5 kW)
- Robust IP67/NEMA Type 4 enclosure rating
- Modular plug and play design
- Quick disconnect connections for I/O, communications, motor, and three-phase power
- Gland plate entry: conduit entrance or ArmorConnect® power media
- Four inputs and two outputs (expandable with ArmorPoint)
- LED status indication
- DeviceNet™ communications
- DeviceLogix™ component technology
- Peer-to-peer communication (ZIP)
- Factory installed option:
  – Hand/Off/Auto (HOA) keypad configuration

Certifications

cULus (File No. E3125, Guides NLDX, NLDX7)

Standards Compliance

UL 508	CSA C22.2, No. 14
EN/IEC 60947-1	CCC

CE Marked per Low Voltage Directive 73/23/EEC and EMC Directive 89/336/EEC

Mode of Operation

Full-Voltage Start

This method is used in applications requiring across-the-line starting. Full in-rush current and locked-rotor torque are realized. The ArmorStart Bulletin 280 offers full-voltage starting, and the Bulletin 281 offers full-voltage starting for reversing applications.

Description of Features

Inputs

The inputs are single keyed (two inputs per connector), which are sourced from DeviceNet power (24V DC), with LED status indication.

Outputs

Two dual-key relay output connectors are supplied as standard. The outputs are sourced from the control voltage power, which is 24V DC with LED status indication.

Overload Protection

The Bulletin 280/281 ArmorStart Distributed Motor Controller incorporates, as standard, electronic motor overload protection. This overload protection is accomplished electronically with an I^2t algorithm. The ArmorStart's overload protection is programmable via the communication network providing the user with flexibility. The overload trip class can be selected for class 10, 15, or 20 protection. Ambient insensitivity is inherent in the electronic design of the overload.

Gland Plate Entrance

The ArmorStart product offers two different methods for connecting incoming three-phase power to the device. One method offered is the traditional conduit entrance which provides a 1 in. conduit hole opening for wiring three-phase power. The second method offers connectivity to the ArmorConnect power media. A factory-installed receptacle is provided for connectivity to both three-phase power media.

Motor Cable

With every Bulletin 280/281 ArmorStart Distributed Motor Controller, a 3-meter unshielded 4-conductor cordset is provided with each unit as standard.

LED Status Indication

The LED Status Indication provides four status LEDs and a Reset button. The LEDs provide status indication for the following:

- **POWER LED**
  The LED is illuminated solid green when control power is present and with the proper polarity
- **RUN LED**
  This LED is illuminated solid green when a start command and control power are present
- **NETWORK LED**
  This bicolor (red/green) LEDs indicates the status of the communication link
- **FAULT LED**
  Indicates Controller Fault (trip) condition
- The "Reset Button" as a local trip reset.

Fault Diagnostics

Fault diagnostics capabilities built in the ArmorStart Distributed Motor Controller help you pinpoint a problem for easy troubleshooting and quick re-starting.

- Short Circuit
- Overload
- Phase Loss
- Control Power Loss
- Control Power Fuse Detection
- I/O Fault
- Output Power Fuse Detection
- Overtemperature
- Phase Imbalance
- DeviceNet Power Loss
- EEPROM Fault
- Hardware Fault

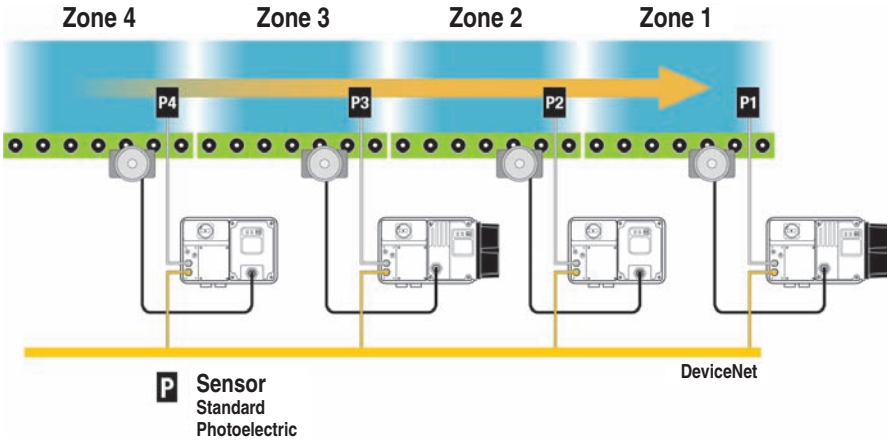
Peer-to-Peer Communications



The Zone Control capabilities of ArmorStart Distributed Motor Controller is ideal for large horsepower (0.5…10 Hp) motored conveyors. The ArmorStart Distributed Motor Controllers have built-in DeviceNet Communications, DeviceLogix technology, and the added Zone Interlocking Parameters (ZIP) which allows one ArmorStart to consume data directly from up to four other DeviceNet nodes without going through the network scanner. These direct communications between conveyor zones are beneficial in a merge, diverter, and accumulation conveyor applications.

Safety I/O Module and TÜV Requirements

ArmorStart Safety-Related Parts

Each ArmorStart Safety Distributed motor controller is intended to be combined with the 1732DS-IB8XOBV4 safety I/O module to form a subsystem that is part of the overall machine stop function. The motor controllers are connected to the safety I/O module through specified cable assemblies. The combination of one of these controllers, the safety module, and the specified interconnecting cables are referred to as the ArmorStart Safety-Related Parts. The part numbers for each of these components is specified below. The combination of these components is shown in Figure E.1. The safety I/O module and PLC program must be configured as outlined. See configuration of Safety I/O Module and PLC program.

Catalog Number	Description

ArmorBlock® Guard I/O™ Modules

	Description	Cat. No.
	ArmorBlock Guard I/O provides all the advantages of traditional distributed I/O for safety systems, but has an IP67 package that can be mounted directly on your machine. On-machine safety I/O reduces wiring time and startup costs for safety controller applications by eliminating electrical boxes and simplifying cable installation. The ArmorBlock family provides industrially hardened I/O blocks that you can mount directly on equipment near sensors or actuators. Wiring the I/O to the sensors and actuators is easy using pre-wired quick disconnect cables. You can use Guard I/O with any safety controller that communicates on DeviceNet using CIP Safety for the control and monitoring of safety circuits. Guard I/O detects circuit failures at each I/O point while providing detailed diagnostics directly to the controller. With CIP Safety, you can easily integrate safety and standard control systems by using safety and standard messages on the same wire. The 1732DS ArmorBlock Guard I/O family consists of 24V DC digital I/O modules that communicate on DeviceNet networks. The I/O connectors are sealed M12 micro style while the network and auxiliary power connectors are sealed mini style. Plus, the ArmorBlock Guard I/O uses the same input and output M12 pin configuration as standard ArmorBlock and Maxum®.	1732DS-IB8XOBV4

Specifications

Description	24V DC Input/Output Module on DeviceNet Networks
Current Consumption	85 mA @ 24V DC
I/O Operating Voltage Range	19.2V…28.8 V DC (24V DC, -20…+20%)
Digital Inputs	
Number of Inputs	8 safety single-channel or 4 safety dual-channel
Input Type	current sinking
Voltage, On-State Input, Min.	11V DC
Voltage, Off-State Input, Max.	5V DC
Current, On-State Input, Min.	3.3 mA

Safety ArmorStart® Distributed Motor Controllers

Bulletin 284D

Bulletin 284D ArmorStart Distributed Motor Controller - Safety Version

Description

The Bulletin 284 ArmorStart Distributed Motor Controller is an integrated, pre-engineered starter for variable frequency AC drive applications. The ArmorStart offers a robust IP67/NEMA Type 4 enclosure design, which is suitable for water wash-down environments. The modular plug-and-play design offers simplicity in wiring the installation. The quick disconnects for the I/O, communication, and motor connection reduce the wiring time and eliminate wiring errors. The ArmorStart offers, as standard, four DC inputs and two relay outputs to be used with sensors and actuators respectively, for monitoring and controlling the application process. The ArmorStart's LED status indication and built-in diagnostics capabilities allows ease of maintenance and troubleshooting. The optional Hand/Off/Auto (HOA) keypad allows for local start/stop control at the ArmorStart Distributed Motor Controller.

The Bulletin 284 ArmorStart Distributed Motor Controller offers short circuit protection per UL 508C and IEC 60947-1. The ArmorStart is rated for local-disconnect service by incorporating the Bulletin 140 Motor Protector as the local-disconnect, eliminating the need for additional components. The ArmorStart Distributed Motor Controllers are suitable for group motor installations.

Safety ArmorStart

The safety version of the ArmorStart provides a safety solution integrated into DeviceNet Safety installations. The Bulletin 284 Safety ArmorStart achieves Category 4 functionality by using redundant contactors. The Safety ArmorStart offers a quick connects via the gland plate to the 1732DS-IB8XOBV4 safety I/O module. The Bulletin 1732DS Safety I/O inputs will monitor the status of the safety rated contactors inside the ArmorStart. The Bulletin 1732DS Safety I/O outputs to provide 24V DC power for control power to the ArmorStart.

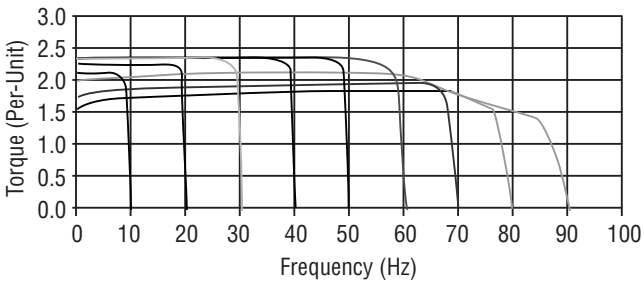
Note: The Bulletin 284 Safety ArmorStart is suitable for safety applications up to Safety Category 4 PLe (TÜV assessment per ISO 13849-1:2008). TÜV compliance letter is available upon request.

Note: For additional information regarding the 1732DS-IB8XOBV4 safety I/O module, see publication 1791DS-UM001*-EN-P.

Mode of Operation

Sensorless Vector Control (SVC)

Sensorless vector control provides exceptional speed regulation and very high levels of torque across the entire speed range of the drive.



ArmorStart with Sensorless Vector Control — 3 Hp, High Speed

Additional Features

- Eight Preset Speeds
- Skip Frequency
- Flying Start
- Auto Restart
- Process Control Loop (PID)
- Step Logic Functionality
- Timer/Counter Functions

Features

- On-Machine starting solution
- Variable frequency AC drive using PowerFlex® technology
- Horsepower range 0.5…5 Hp (0.4…3.3 kW)
- Robust IP67/NEMA Type 4 enclosure rating
- Modular plug and play design
- Quick disconnect connections for I/O, communications, motor, and three-phase power
- Four inputs and two outputs (expandable with ArmorPoint)
- LED status indication
- DeviceNet communications
- DeviceLogix component technology
- Peer-to-peer communications (ZIP)
- Factory installed options:
  - EMI filter
  - Dynamic brake connector
  - Hand/Off/Auto (HOA) keypad configuration
  - Source brake contactor
  - Shielded motor cable
  - Output contactor
  - Hand/Off/Auto (HOA) Keypad Configuration
  - EMI Filter
  - Dynamic Brake Connector
  - Output Contactor
  - Control Brake Contactor
  - Source Brake Contactor
  - Shielded Motor Cable
  - Safety Monitor
  - 0…10V Analog Input

Standards Compliance

UL 508C
CSA C22.2, No. 14
EN/IEC 60947-1, EN 50178, EN 61800-3
CE Marked per Low Voltage Directive 73/23/EEC and EMC Directive 89/336/EEC

Certifications

cULus (File No. E207834, Guide NMMS, NMMS7)

Description of Features

Overload Protection

The Bulletin 284 ArmorStart Distributed Motor Controller incorporates, as standard, electronic motor overload protection. This overload protection is accomplished electronically with an I^2t algorithm. The ArmorStart's overload protection is programmable via the communication network providing the user with flexibility. The overload trip class allows for class 10 overload protection. Ambient insensitivity is inherent in the electronic design of the overload.

Gland Plate Entrance

The ArmorStart product offers two different methods for connecting incoming three-phase power to the device. One method offered is the traditional conduit entrance which provides a 1 in. conduit hole opening for wiring three-phase power. The second method offers connectivity to the ArmorConnect power media. A factory installed receptacle is provided for connectivity to three-phase power media.

Motor Cable

With every Bulletin 284 ArmorStart Distributed Motor Controller, a 3 m unshielded 4-conductor cordset is provided with each unit as standard. If the optional EMI filter is selected, a 3 m shielded 4-conductor cordset is provided with each unit as standard.

LED Status Indication

The LED Status Indication provides four status LEDs and a Reset button. The LEDs provide status indication for the following:

- **POWER LED**
  The LED is illuminated solid green when control power is present and with the proper polarity
- **RUN LED**
  This LED is illuminated solid green when a start command and control power are present
- **NETWORK LED**
  This bicolor (red/green) LEDs indicates the status of the communication link
- **FAULT LED**
  Indicates Controller Fault (trip) condition
- The "Reset Button" as a local trip reset.

Inputs

The inputs are single keyed (two inputs per connector), which are sourced from DeviceNet power (24V DC), with LED status indication.

Outputs

Two dual-key relay output connectors are supplied as standard. The outputs are sourced from the control voltage power, which is 24V DC with LED status indication.

Fault Diagnostics

Fault diagnostics capabilities built into the Bulletin 284 ArmorStart Distributed Motor Controller help you pinpoint a problem for easy troubleshooting and quick re-starting.

- Short Circuit
- Overload
- Phase Short
- Ground Fault
- Stall
- Control Power Loss
- Control Power Fuse Protection
- I/O Fault
- Overcurrent
- Brake Fuse Protection
- Overtemperature
- Output Fuse Protection
- DeviceNet Power Loss
- Internal Communication Fault
- DC Bus Fault
- EEPROM Fault
- Hardware Fault
- Restart Retries
- Miscellaneous Fault

Factory Installed Options

HOA Selector Keypad with Jog Function

The HOA Selector Keypad with Jog Function allows for local start/stop control with capabilities to JOG and to Forward/Reverse motor direction.

EMI Filter

The EMI Filter option is required if the Bulletin 284 ArmorStart Distributed Motor requires to be CE compliant. If the EMI Filter is selected, a 3–meter shielded 4–conductor cordset is provided as standard. This option is only available with sensorless vector control.

Dynamic Brake Connector

A 3 m, 3-pin cable for connection to a dynamic brake module is provided as standard when this option is selected. See Accessories on page 6-22 for available dynamic brake modules.

Source Brake Contactor

An internal contactor is used to switch the electromechanical motor brake on/off. The motor brake is powered from the main power circuit. A customer accessible 3.0 A fuse is provided to protect the brake cable. A 3-meter, 3-pin cable for connection to the motor, is provided as standard when this option is selected.

Shielded Motor Cable

A 3-meter shielded 4-conductor cordset is provided instead of the 3-meter unshielded 4-conductor cordset. If the EMI Filter is selected, a 3-meter shielded 4-conductor cordset is provided as standard.

Cat. No. Explanation

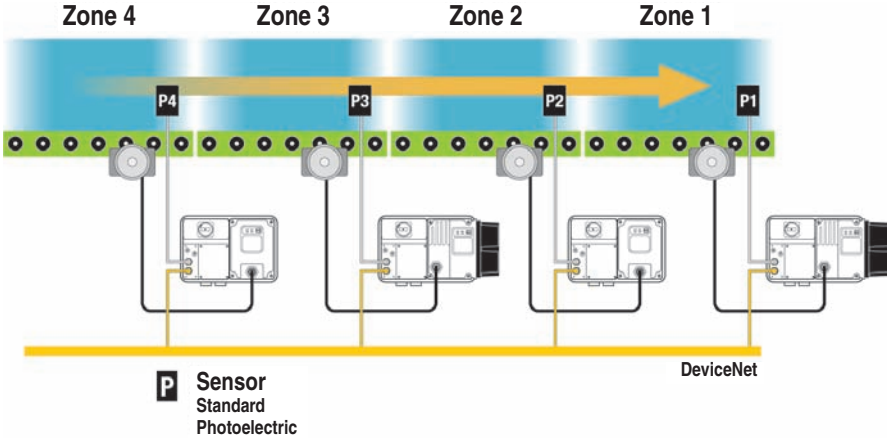
4 (5)	284R-120P1K2-M∗	120	0.26	52	124%	100%	13%	124%	10%

∗ Indicates cable length (0.5 m or 1.0 m).
⌘ Always check the resistor ohms against the minimum resistance for the drive being used.
§ The duty cycle listed is based on full speed to zero speed deceleration. For constance regen at full speed, the duty cycle capability is half of the listed value. Application Type 1 represents maximum capability up to 100% braking torque where possible. Application Type 2 represents more than 100% braking torque where possible, up to a mximum of 150%.

Peer-to-Peer Communications



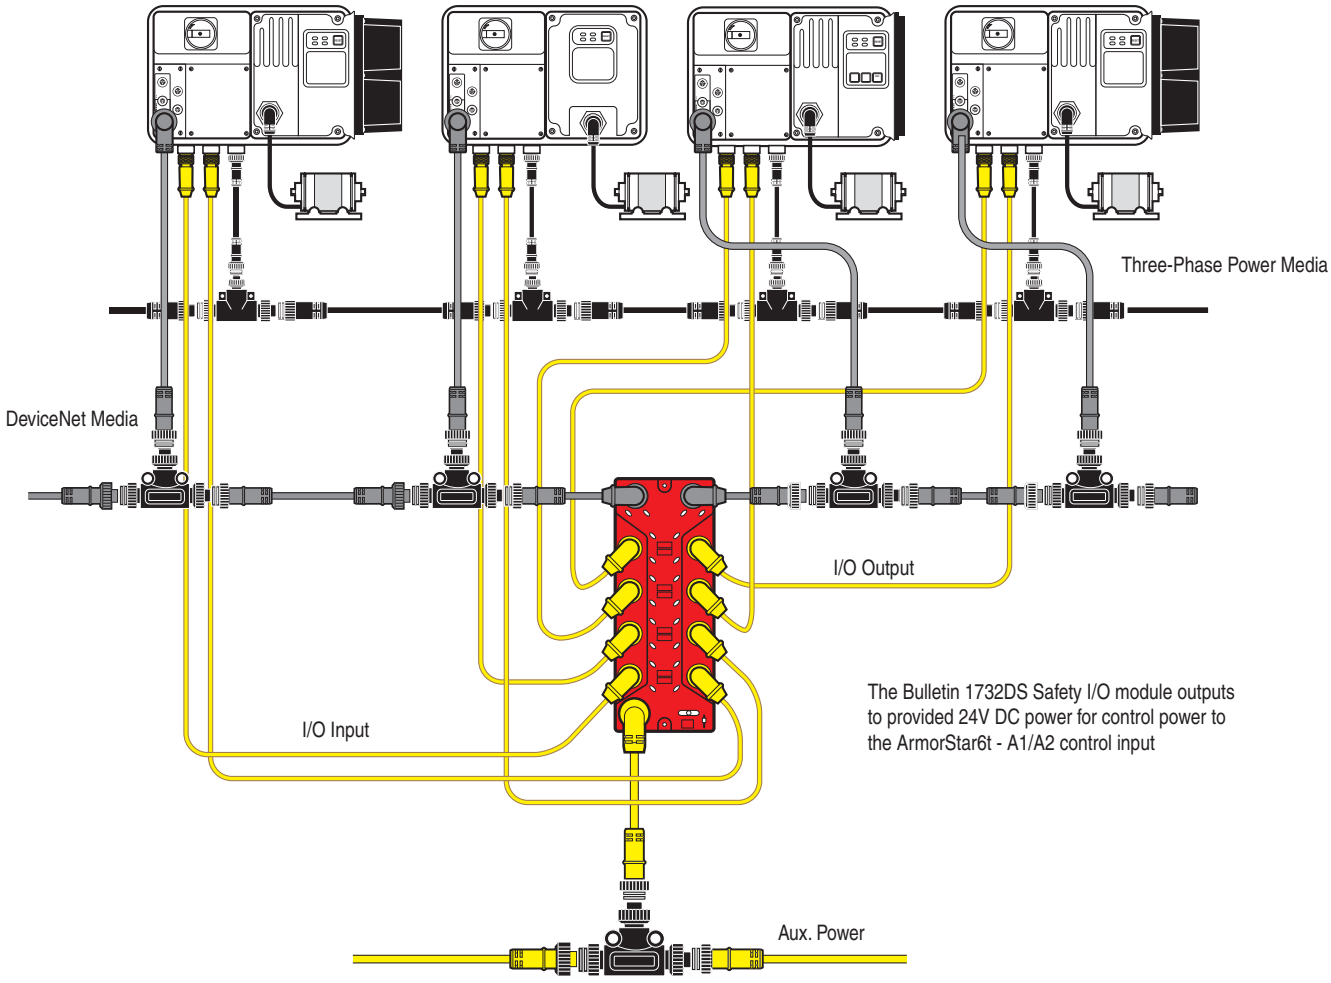
The Zone Control capabilities of ArmorStart Distributed Motor Controller is ideal for large horsepower (0.5…10 Hp) motored conveyors. The ArmorStart Distributed Motor Controllers have built-in DeviceNet Communications, DeviceLogix technology, and the added Zone Interlocking Parameters (ZIP) which allows one ArmorStart to consume data directly from up to four other DeviceNet nodes without going through the network scanner. These direct communications between conveyor zones are beneficial in a merge, diverter, and accumulation conveyor applications.

Safety I/O Module and TÜV Requirements

ArmorStart Safety-Related Parts

Each ArmorStart Safety Distributed motor controller is intended to be combined with the 1732DS-IB8XOBV4 safety I/O module to form a subsystem that is part of the overall machine stop function. The motor controllers are connected to the safety I/O module through specified cable assemblies. The combination of one of these controllers, the safety module, and the specified interconnecting cables are referred to as the ArmorStart Safety-Related Parts. The part numbers for each of these components is specified below. The combination of these components is shown in Figure E.1. The safety I/O module and PLC program must be configured as outlined. See configuration of Safety I/O Module and PLC program.

Catalog Number	Description
280…S* * - denotes safety version of Bulletin 280	Bulletin 280 Distributed Motor Controller – controller is full-voltage, non-reversing
281…S* * - denotes safety version of Bulletin 281	Bulletin 281 Distributed Motor Controller – controller is full-voltage, reversing
284…S* * - denotes safety version of Bulletin 284	Bulletin 284 Distributed Motor Controller – controller is variable-frequency AC drive
1732DS-IB8XOBV4	Guard I/O DeviceNet Safety Module
889D-F4HJDM-*, 889D-F4AEDM-* or equivalent * - denotes length	• SM cable assembly - Interconnecting cable assembly between safety module input and ArmorStart controller connector labeled “SM”. Assembly provides contactor position feedback. • A1/A2 cable assembly - Interconnecting cable assembly between safety module output and ArmorStart controller connector labeled “A1/A2”. Assembly provides output contactor coil power and controller power supply.



The Bulletin 1732DS Safety I/O module inputs will monitor the status of the safety-related contactors inside the ArmorStart - SM safety monitor input

ArmorBlock® Guard I/O™ Modules

	Description	Cat. No.
	ArmorBlock Guard I/O provides all the advantages of traditional distributed I/O for safety systems, but has an IP67 package that can be mounted directly on your machine. On-machine safety I/O reduces wiring time and startup costs for safety controller applications by eliminating electrical boxes and simplifying cable installation. The ArmorBlock family provides industrially hardened I/O blocks that you can mount directly on equipment near sensors or actuators. Wiring the I/O to the sensors and actuators is easy using pre-wired quick disconnect cables. You can use Guard I/O with any safety controller that communicates on DeviceNet using CIP Safety for the control and monitoring of safety circuits. Guard I/O detects circuit failures at each I/O point while providing detailed diagnostics directly to the controller. With CIP Safety, you can easily integrate safety and standard control systems by using safety and standard messages on the same wire. The 1732DS ArmorBlock Guard I/O family consists of 24V DC digital I/O modules that communicate on DeviceNet networks. The I/O connectors are sealed M12 micro style while the network and auxiliary power connectors are sealed mini style. Plus, the ArmorBlock Guard I/O uses the same input and output M12 pin configuration as standard ArmorBlock and Maxum.	1732DS-IB8XOBV4

Specifications

Description	24V DC Input/Output Module on DeviceNet Networks
Current Consumption	85 mA @ 24V DC
I/O Operating Voltage Range	19.2V…28.8 V DC (24V DC, -20…+20%)
Digital Inputs	
Number of Inputs	8 safety single-channel or 4 safety dual-channel
Input Type	current sinking
Voltage, On-State Input, Min.	11V DC
Voltage, Off-State Input, Max.	5V DC
Current, On-State Input, Min.	3.3 mA
Digital Outputs	
Number of Outputs	4 safety solid-state
Output Type	dual channel, current sourcing/current sinking pair
Output Current Rating	2.0 A max per point
Short Circuit Protection	Yes
Standard Pulse Test Outputs	
Number of Pulse Test Sources	8
Pulse Test Output Current	0.7 A per point
Short Circuit Protection	Yes
General	
Temperature, operating	-20…+60 °C (-4…+140 °F)
Relative Humidity	10…95% non-condensing
Vibration	0.76 mm @ 10…500 Hz
Shock, operating	30 g
Enclosure Protection	IP67
Dimensions (HxWxD), Metric	179 x 70 x 68.7 mm✶
Dimensions (HxWxD), Imperial	7.05 x 2.76 x 2.71 in.✶
Weight, Metric	600 g
Weight, Imperial	1.2 lb
Certifications❄	UL, CE, C-Tick, CSA, UL NRGF, ODVA Conformance, TÜV certified for functional safety up to SIL 3 and Cat. 4, PLe

✶ Includes terminal block.
❄ When product is marked. See the Product Certification link at http://www.ab.com/certification for Declarations of Conformity, Certificates, and other certification details.
All specifications are subject to change. Refer to product installations instructions.

Help improve machine uptime and reduce wear and tear with safety-rated PowerFlex and Kinetix drives

The requirement for a machine to be placed in a safe state often needs to be done with a high level of confidence. Many times this is necessary to perform routine maintenance, correct a mechanical problem, or in some cases it may happen very frequently as part of the normal machine process cycle (e.g. punch press). Finding a way to do this without removing power from the system and performing a lockout / tagout procedure can improve process up-time, and reduce wear and stress on mechanical and electrical components. Also, providing an efficient way to exercise functional safety can reduce the chances of safety system tampering.

Safe Torque-Off

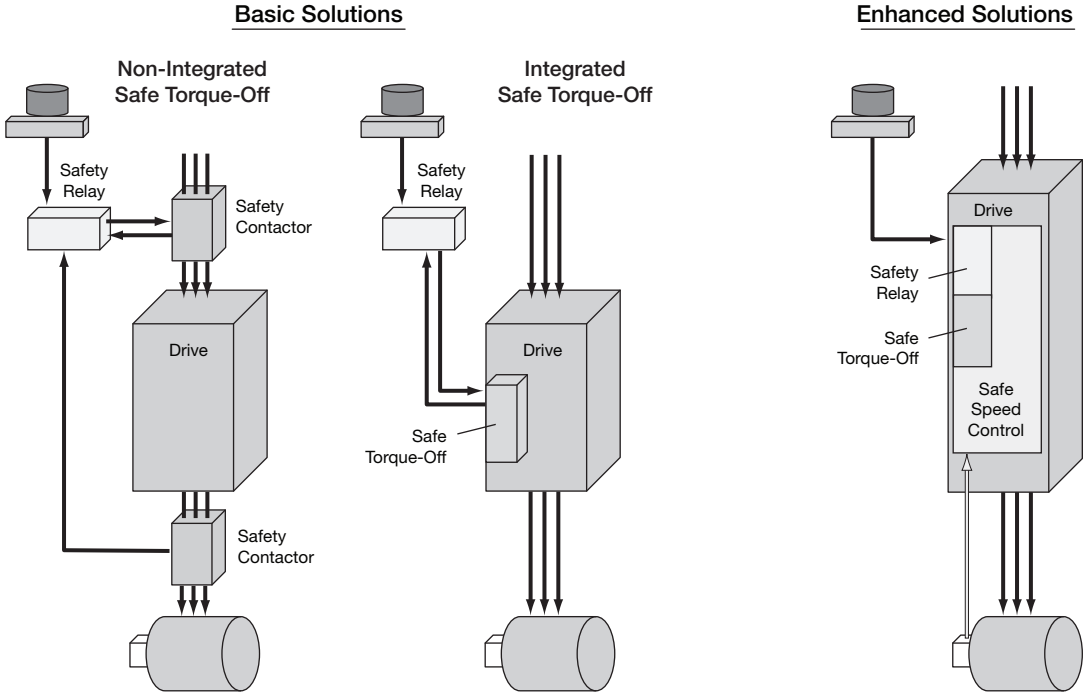
For many drive applications, simple removal of torque is all that is necessary to perform the desired task (e.g. maintenance). This function is referred to as Safe Torque-Off (also known as DriveGuard or GuardMotion), and can be accomplished with the use of a standard drive, along with external safety components (e.g. safety contactors) to place the system in a safe state. Some of the PowerFlex and Kinetix drive products reduce the amount of external safety components by integrating safe torque-off functionality inside the drive. Using the integrated solution simplifies the safety circuit design, and reduces panel space and cost. In either case, whether the function is implemented inside or outside the drive, it can be designed to meet the requirements of relevant safety standards.

Safe Speed Monitor

For applications able to benefit from more advanced safety features, Allen-Bradley offers a Safe Speed Monitor option that uses machine or motor velocity feedback for even greater flexibility in how safety can be deployed. This new offering helps provide safety zone access while there is limited motion. By reducing and monitoring the speed of an application, an operator may safely inspect and perform a process operation or maintenance work without stopping the machine, resulting in reduced downtime and reduced production waste. The Safe Speed Monitor is configurable for following functions:

- Safe Torque-Off
- Stop Categories 0, 1 and 2
- Safe Stop
- Safe Limited Speed
- Safe Maximum Speed
- Safe Maximum Acceleration
- Safe Direction
- Zero Speed Monitoring
- Door Control and Monitoring
- Enabling Switch Input

In addition to the safe monitoring of speed dependent functions, the Safe Speed Monitor integrates the functionality of a safety monitoring relay, providing direct inputs for interfacing door locks, light curtains, E-Stop pushbuttons, enabling switches, and key switches. While this can be accomplished with a standard drive and a separate speed monitoring relay (Allen-Bradley MSR57), select PowerFlex and Kinetix drives are capable of integrating this functionality internally, again simplifying the safety system, and reducing panel space and cost.



Safety Solutions for PowerFlex® Drives

Overview

The Allen-Bradley PowerFlex 40P, 70, 700H, 700L, 700S, 753 and 755 offer certified safety options to help provide integral, cost-effective, and certified protection for AC drive control.

All safety options are available as a kit for user installation.

Safety Solutions for PowerFlex® Drives

PowerFlex 40P AC Drive

The PowerFlex 40P AC drive addresses user needs for closed loop control with an option for Category 3 Safe Torque-off in a compact and cost effective design. Based on the popular PowerFlex 40 this drive is designed to meet global OEM and end-user demands for flexibility, space savings and ease of use. This drive is a cost-effective alternative for speed or basic position control of applications such as diverters, smart conveyors, packaging machines, palletizers, drafting machines, ring spinning machines and synthetic fiber spinning machines and shares common options and accessories with the PowerFlex 40.

✶ Meets IP40/54/65 (NEMA 1/12/4/4X) when installed in an enclosure of like rating.

Options

Human Interface Modules and Accessories

Description	Cat. No.
Remote (Panel Mount) LCD Display, Digital Speed Control, CopyCat Capable. Includes 2.0 meter cable. IP66, NEMA Type 4X/12 - Indoor Use Only.	22-HIM-C2S §
Remote Handheld, LCD Display, Full Numeric Keypad, Digital Speed Control, CopyCat Capable. Includes 1.0 meter cable. IP30, NEMA Type 1. Panel mount with optional Bezel Kit.	22-HIM-A3
Remote Handheld, Wireless Interface Module with Bluetooth® Technology. IP30, NEMA Type 1. Panel Mount with optional Bezel Kit.	22-WIM-N1
Remote (Panel Mount), Wireless Interface Module with Bluetooth Technology. IP66, NEMA Type 4X/12 - Indoor Use Only.	22-WIM-N4S
Bezel Kit. Panel Mount for LCD Display, Remote Handheld Unit. IP30, NEMA Type 1. Includes a 22-RJ45CBL-C20 cable.	22-HIM-B1
DSI HIM Cable (DSI HIM to RJ45 cable)	
1.0 Meter (3.3 Feet) DSI HIM Cable (DSI HIM to RJ45 cable)	22-HIM-H10
2.9 Meter (9.51 Feet) DSI HIM Cable (DSI HIM to RJ45 cable)	22-HIM-H30

§ The 22-HIM-C2S is smaller than the 22-HIM-C2 and cannot be used as a direct replacement.

Communication Option Kits

Description	Cat. No.
ControlNet™ Communication Adapter	22-COMM-C ♣
DeviceNet™ Communication Adapter	22-COMM-D ♣
EtherNet/IP™ Communication Adapter	22-COMM-E ♣
LonWorks® Communication Adapter	22-COMM-L ♣
PROFIBUS™ DP Communication Adapter	22-COMM-P ♣
Serial Converter Module (RS485 to RS232). Provides serial communication via DF1 protocol for use with DriveExplorer and DriveExecutive™ software. Includes DSI to RS232 serial converter, 1203-SFC serial cable, 22-RJ45CBL-C20 cable, and DriveExplorer Lite CD.	22-SCM-232
Serial Cable. 2.0 meter with a locking low profile connector. Connects the serial converter to a 9-pin sub-miniature D female computer connector.	1203-SFC
Serial Null Modem Adapter. Use when connecting the serial converter to DriveExplorer on a handheld PC.	1203-SNM
Universal Serial Bus™ (USB) Converter includes 2m USB, 20-HIM-H10 & 22-HIM-H10 Cables	1203-USB
DSI Cable. 2.0 meter RJ45 to RJ45 cable, male to male connectors.	22-RJ45CBL-C20
Splitter Cable. RJ45 one to two port splitter cable.	AK-U0-RJ45-SC1
Terminal Block. RJ45 two position terminal block (6 pieces) with two 120 Ohm terminating resistors (loose).	AK-U0-RJ45-TB2P
Terminating Resistors. 120 Ohm resistor embedded in an RJ45 connector (2 pieces).	AK-U0-RJ45-TR1
DSI External Communications Kit. External mounting kit for 22-COMM Communication Adapters.	22-XCOMM-DC-BASE
External Communications Kit Power Supply Optional 100…240V AC Power Supply for External DSI Communications Kit.	20-XCOMM-AC-PS1
Compact I/O Module (3 Channel)	1769-SM2
Communication Adapter Cover Houses the Communication Adapter for B & C Frame drives. Note: Cover adds 25 mm (0.98 in.) to the overall depth of the drive.	
Frame B Drive	22D-CCB ➢
Frame C Drive	22D-CCC ➢

♣ Requires a Communication Adapter Cover when used with Frame B & C PowerFlex 40/40P drives or Frame C PowerFlex 400 drives.
➢ If IP30, NEMA/UL Type 1 is required, a 22-JBCB (Frame B drives) or 22-JBCC (Frame C drives) must also be ordered.

✶ This filter is suitable for use with a cable length of up to 10 meters for Class A and 1 meter for Class B environments.
❄ Drives are available in these ratings with internal "S Type" filters.
‡ This filter is suitable for use with a cable length of up to 100 meters for Class A and 5 meters for Class B environments.
➢ Filter must be Series B or later.

The PowerFlex 70 offers a compact package of power, control and operator interface, designed to meet the demands for space, simplicity and reliability. This drive provides a broad spectrum of features, allowing you to easily integrate it into your architecture and configure it for most application needs.

The PowerFlex 700H drive is ideal for high power applications requiring speed control performance. This drive provides excellent torque at low speeds for demanding speed control applications and has configurable control modes for a wide variety of applications. The PowerFlex 700H also has an ATEX certified option for drives that operate in potentially explosive environments.

IP21, NEMA Type 1

✶ These drives have dual current ratings; normal duty applications and heavy duty applications (in parenthesis). The drive may be operated at either rating.
❄ The 2 sec. output current is only available at initial start or drive operating at light load.
➢ Drives listed do not include a Control and I/O option.

The PowerFlex 700S offers optimized integration for the most demanding stand-alone and coordinated drive control and drive system applications. The PowerFlex 700S offers a DriveLogix option which combines the powerful performance and flexible control of PowerFlex AC drives with a high-performance Logix engine to produce a highly functional, cost-effective drive and control solution.

Ratings	200…240V:	0.75…66 kW / 1…100 Hp / 4.2…260 A
	380…480V:	0.75…800 kW / 1…1250 Hp / 2.1…1450 A
	500…600V:	0.75…1500 kW / 1…1600 Hp / 1.7…1500 A
	690V:	45…1500 kW / 50…1600 Hp / 77…1500 A
Motor Control	• V/Hz control • Vector Control with FORCE Technology (with and without encoder) • Permanent Magnet Motor Control	
Communications	Common Industrial Protocol	
User Interface	HIM (option)	
Enclosures	IP20, IP21	
Safety	DriveGuard Safe Torque-Off / EN 954-1 Cat. 3	
Additional Features	• Integrated position loop for simple indexing to electronic line shaft applications • SynchLink for high speed data transfer and synchronization • Multiple motor feedback options • DriveLogix	
Certifications	• UL • cUL • CE • C-Tick • IEC (Designed to Meet) • TÜV FS ISO/EN13849-1 (EN954-1) with Safe Torque-Off option • RINA, Frames 1…10	
Options	See pages 6-65…6-74	

IP20, NEMA/UL Type 1

❄ These drives have dual current ratings; one for normal duty applications, and one for heavy duty applications (in parenthesis). The drive may be operated at either rating.
‡ 600V class drives at 820 amps (ND) such as 20DF820 & 20DE820 are only capable of producing 95% of starting torque under 10 Hz.
§ Also available with internal Brake IGBT (20DxxxxA0E **Y** NANANE).
♣ CE Certification testing has not been performed on 600V class drives Frames 1…4.
➢ 690V drives are Frame 5.

Options	See pages 6-65…6-74	

The PowerFlex 700L is available with the PowerFlex 700 or PowerFlex 700S control in a fully regenerative, liquid-cooled power structure. This powerful combination offers great performance and high power capabilities in a small package along with low harmonics.

Available as a panel mount unit or in a cabinet, this liquid cooled drive features regenerative braking which is ideal for precise, high-response speed and position control, continuous holdback, rapid deceleration and stopping of high inertia loads. Instead of wasting energy with resistor braking technology, regenerative braking actually puts the energy back into the system to be used by other equipment.

Cooling Loops

Drive Requirements		Supply Loop Requirements			Liquid to Liquid Heat Exchanger ❄
Frame Size	Heat Dissipation into Liquid	Minimum Flow @ Pressure ✶	Maximum Pressure	Temperature Range	Cat. No.
2	7,900 W	15.1 LPM @ 0.83 bar (4 GPM @ 12 PSI)	8.62 bar (125 PSI)	0…40 °C (32…104 °F)	20L-LL13K-P75A
3A	12,000 W	22.7 LPM @ 0.83 bar (6 GPM @ 12 PSI)	8.62 bar (125 PSI)	0…35 °C (32…95 °F)	20L-LL13K-P75A
3B	24,000 W	56.8 LPM @ 0.83 bar (15 GPM @ 12 PSI)	8.62 bar (125 PSI)	0…35 °C (32…95 °F)	20L-LL24K-1P0A

✶ The minimum pressure applies to the pressure drop across the drive and does not take into account additional pressure drop in the system such as piping or hosing.

❄ Recommended cooling loops shown are based on a single drive per cooling loop. Consult your local Rockwell Automation sales office or Allen-Bradley distributor for use of multiple drives on one cooling loop.

‡ Each hose kit contains (2) hoses and the appropriate connectors.

Designed for general purpose applications, the PowerFlex 753 AC drive offers multiple options and features along with the added benefit of simple integration. The PowerFlex 753 comes standard with built-in I/O making it a cost effective solution ideal for OEMs and system integrators looking to reduce engineering costs, deliver machines to market faster and meet end-user demand for more productive and safer machines.

‡ Some drives have dual current ratings; one for normal duty applications, and one for heavy duty applications (in parenthesis). The drive may be operated at either rating.

Note: Frames 6…7 require a user installed flange kit with an IP00, NEMA/UL Type Open drive.

Designed for ease of integration, application flexibility and performance the PowerFlex 755 AC drive provides improved functionality across many manufacturing systems. The PowerFlex 755 AC drive is designed to maximize user's investment and help improve productivity. Ideal for applications that require safety, high motor control performance, and application flexibility, the PowerFlex 755 is highly functional and cost effective solution.

Ratings	380…480V: 0.75…250 kW / 1…350 Hp / 2.1…456 A
Motor Control	• V/Hz Control • Vector Control with FORCE Technology • Sensorless Vector Control • Permanent Magnet Motor Control
Communications	Embedded EtherNet/IP port standard, Common Industrial Protocol
User Interface	HIM (option)
Enclosures	IP00/IP20, Flange Mount, IP54/NEMA/UL Type 12
Safety	• Safe Torque-Off PLe/SIL3 Cat. 3 • Safe Speed Monitor PLe/SIL3 Cat. 4
Additional Features	• DeviceLogix • Preventative Diagnostics • Five option slots for I/O, feedback, safety, auxiliary control power, communications • Accurate positioning with PCAM, Indexer, Electronic Gearing, and speed/position profiling • Incremental and Absolute feedback supported • TorqProve for lifting applications • Conformal Coating
Certifications	• UL • cUL • CE • C-Tick • SEMI F47 • GOST-R • TÜV FS ISO/EN13849-1 (EN954-1) with Safe Torque-Off option • Meets material restrictions specified in the RoHS directive
Options	See pages 6-65…6-74

∗ The 11th character determines default Filtering and Common Mode Cap jumper configuration. "J" = Installed, "A" = Removed.

‡ Some drives have dual current ratings; one for normal duty applications, and one for heavy duty applications (in parenthesis). The drive may be operated at either rating.

Note: Frames 6…7 require a user installed flange kit with an IP00, NEMA/UL Type Open drive.

∗ Duty cycle listed is based on full speed to zero speed deceleration. For constant regen at full speed, duty cycle capability is half of what is listed. Application Type 1 represents maximum capability up to 100% braking torque where possible. Application Type 2 represents more than 100% braking torque where possible, up to a maximum of 150%.

❄ Always check resistor Ohms against minimum resistance for drive being used.

PowerFlex 70 Medium Duty External Dynamic Brake Resistors

These resistors provide a larger duty cycle capability than the internal type. Includes an internal thermal switch for use in external safety circuit.

1492 Wiring System Modules and Cables

Wiring System Modules and Cables provide an easy means to extend drive control wiring. A pre-wired cable (available in various lengths) plugs into the appropriate drive I/O terminal block. The remaining cable end plugs into the Wiring Module which provides a terminal block for direct I/O connection. See publication 1492-TD008 for detailed information.

1492 Wiring Module and Cable Selection

Servo Drive Comparison

Kinetix® Integrated Motion systems help increase machine productivity with GuardMotion™ technology. GuardMotion is the basis for safety innovations integrated into Kinetix motion products. Safe-off, also known as Safe Torque-off, helps machine builders and manufacturers implement machine solutions that provide safety and maximum availability. Tasks such as machine setup, cleaning, removal of jams and other typical maintenance work that previously required power-down conditions can now be accomplished without removing power from the entire machine. With the Safe-off capability, the drive output is safely disabled to eliminate motor torque. As a result, users enjoy faster machine restart and shorter machine downtime. In addition, components such as output contactors can be eliminated, simplifying machine design and reducing both panel space requirements and overall system cost.

Kinetix 6200 and Kinetix 6500 drives offer Safe Speed Monitoring, as well as Safe-off capability.

GuardMotion drives can be identified by the GuardMotion logo on the front label of the drive.

Safety Solutions for Kinetix® Servo Drives

Kinetix 300 Drives

Features

- PLd, Category 3 per ISO 13849-1
- Stop Category 0 per EN 60204-1
- Removable terminals
- Common solution for any power range

Kinetix 300 Specifications

Standards	IEC/EN 60204-1, ISO 13849-1
Category	PLd, Category 3 per ISO 13849-1
Certifications	CE, cUL, and TÜV functional safety
Safety Inputs	Insulated, compatible with single-ended output (+24V DC)
Enable Voltage Range	20…24V DC
Disable Voltage Range	0…1.0V DC
Input Impedance	6.8 k Ω
Safety Status	Isolated Open Collector (Emitter is grounded.)
Output Load Capability	100 mA
Response Time	Less than 1 ms
Recommended Conductor Size Terminal Screw	Stranded Wire with Ferrule: 0.75 mm² (18 AWG) Solid Wire: 1.5 mm² (16 AWG)
Recommended Torque Terminal Screw	0.2 N•m (1.8 lb•in)
Safety Status	Isolated Open Collector (Emitter is grounded.)
User Manual	Kinetix® 300 User Manual, publication 2097-UM001

Description

Kinetix® 300 EtherNet/IP Indexing servo drives help protect personnel and increase machine productivity with Safe Torque-off functionality. The Kinetix 300 drive implements solid-state safety circuits for excellent reliability.

Kinetix 6200 and Kinetix 6500 Drives

Kinetix 6200

Kinetix 6500

Safe Speed Servo Drives

Description

Kinetix® 6200 and Kinetix® 6500 servo drives have safety features that help improve machine operating efficiencies by providing safer access to guarded areas while a machine or process continues operation under limited conditions. Leveraging the proven performance of the Kinetix 6000 family, these drives include features such as safe stop, zero speed monitoring, safe direction monitoring, and safe maximum acceleration monitoring. Control modules couple with IAM and AM power modules to provide drive status indicators and an interface to I/O, communication, safety functionality, and feedback.

The Kinetix 6200 features a SERCOS interface, while the Kinetix 6500 provides EtherNet/IP network connectivity. Both drives offer Safe Torque-off or Safe Speed Monitoring options.

Features

- TÜV-certified up to and including SIL3 per IEC 61508 and PLe per ISO 13849-1
- Reduce panel space and eliminate wiring between external safety monitor and the drive because of the drive's embedded safety
- Interchangeable control modules let you easily transform from Safe-off to Safe Speed functionality or from SERCOS interface™ to EtherNet/IP networking
- Embedded, dual-channel monitoring capability
- Includes automatic, manual, or manual monitored reset
- Supports cascaded system via solid state safety outputs
- Uses the same Allen-Bradley motors and actuators as the Kinetix 6000, including the MP-series low inertia, medium inertia, stainless steel and food grade motors, RDD-series direct drive motors, LDC-series linear motors, MP-series linear stages, MP-series electric cylinders

Kinetix 6200 and Kinetix 6500 Specifications

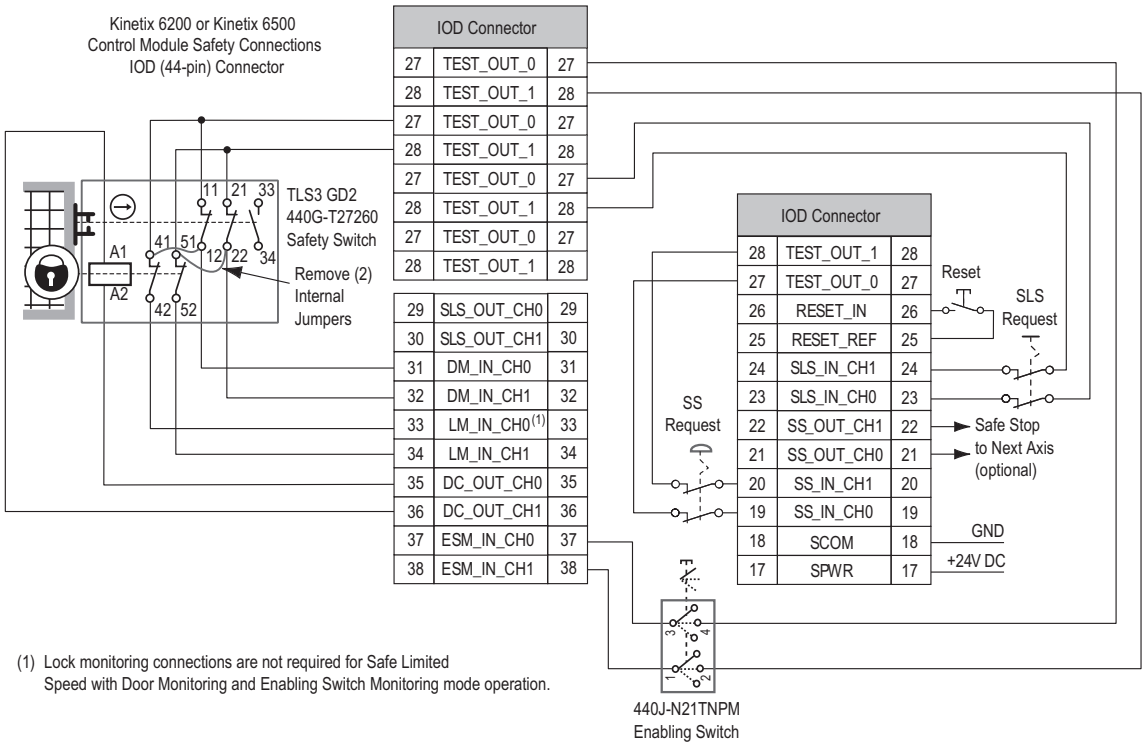
Kinetix 6200 Safe Limited Speed with Door Monitoring and Enabling Switch Monitoring Configuration

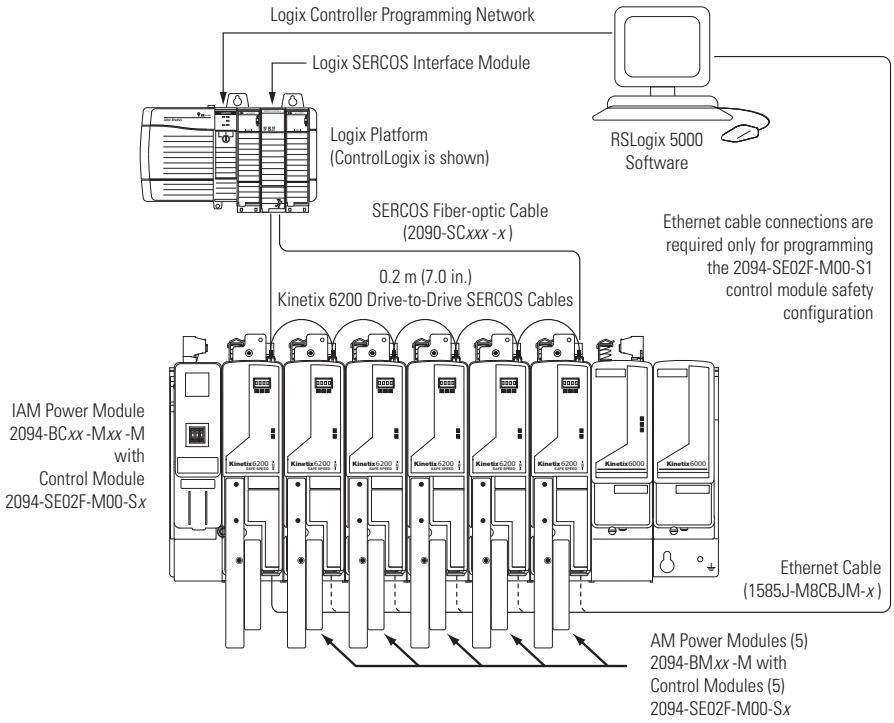
The Kinetix 6200 drive is shown wired for Safe Limited Speed with Door Monitoring and Enabling Switch Monitoring, one of 11 user-selectable operating modes, based on combinations of available safety functions. The proper configuration of this speed monitoring mode in RSLogix™ 5000 software is required.



(1) Lock monitoring connections are not required for Safe Limited Speed with Door Monitoring and Enabling Switch Monitoring mode operation.

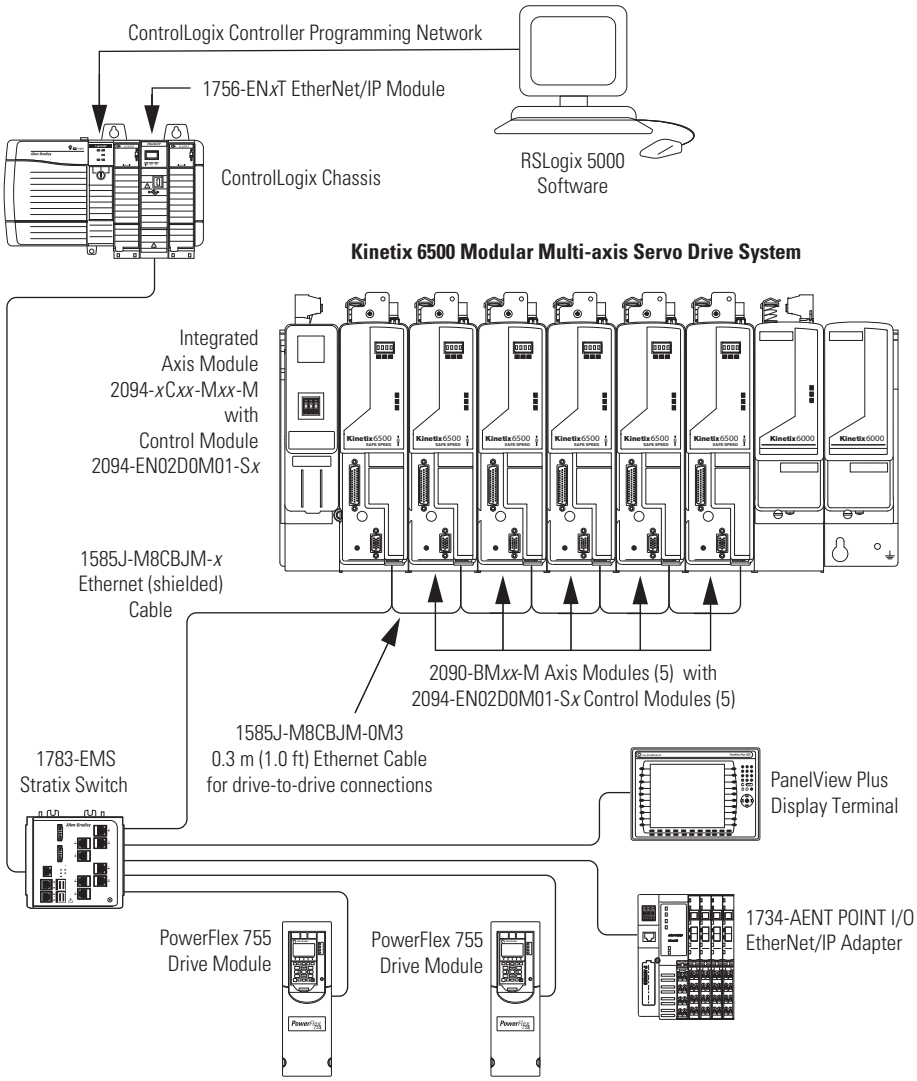
Kinetix 6200 Communication Configuration (SERCOS)

This Kinetix 6200 drive configuration uses the SERCOS interface for configuring the Logix module and Ethernet for diagnostics and configuring safety functions.



Kinetix 6500 Star Communication Configuration (EtherNet/IP)

In this Kinetix 6500 drive configuration, the devices are connected using star topology. Each device is connected directly to the switch, making this topology fault tolerant. The 2094 power rail modules and other devices operate independently. The loss of one device does not impact the operation of the other devices.



Accessories

Drive-to-drive SERCOS Cables for Kinetix 6200 Drives

For I/O, Safety, Motor Feedback, and Auxiliary Feedback connections on Kinetix 6200 and Kinetix 6500 Safe Speed drives, use the 44-pin Low-profile Connector Kit, catalog number 2090-K6CK-D44M.

A 1585J-M8CBJM-x (shielded) Ethernet cable is required for programming and safety configuration of the Kinetix 6200 and Kinetix 6500 drive via RSLogix 5000 software.

Safety Solutions for Kinetix® Servo Drives

Kinetix 6000 and Kinetix 7000 Drives

Kinetix 6000

Kinetix 7000

Description

The Kinetix® 6000 multi-axis servo drive provides power simplicity to handle even the most demanding applications quickly, easily, and cost-effectively. The compact size, simplified wiring, easy-to-use components, and integrated Safe-off capability make Kinetix 6000 drives an ideal choice for both OEMs and end-users.

The Kinetix® 7000 high power servo drive is designed to accommodate the most demanding requirements and extends the benefits of Kinetix Integrated Motion, and Safe-off capability to applications up to 149 kW. The Kinetix 7000 high power drive supports three-phase AC input power (380…480V AC) and DC input for common bus applications.

Features

- Category 3 per EN 954-1
- SIL3 per IEC 61508
- Stop Category 0 per EN 60204-1
- Stop Category 1 per EN 60204-1 (requires safety relay with time delay outputs)
- Two positive-guided, mechanically linked safety auxiliary contacts for monitoring
- Removable terminals
- Common solution for any power range

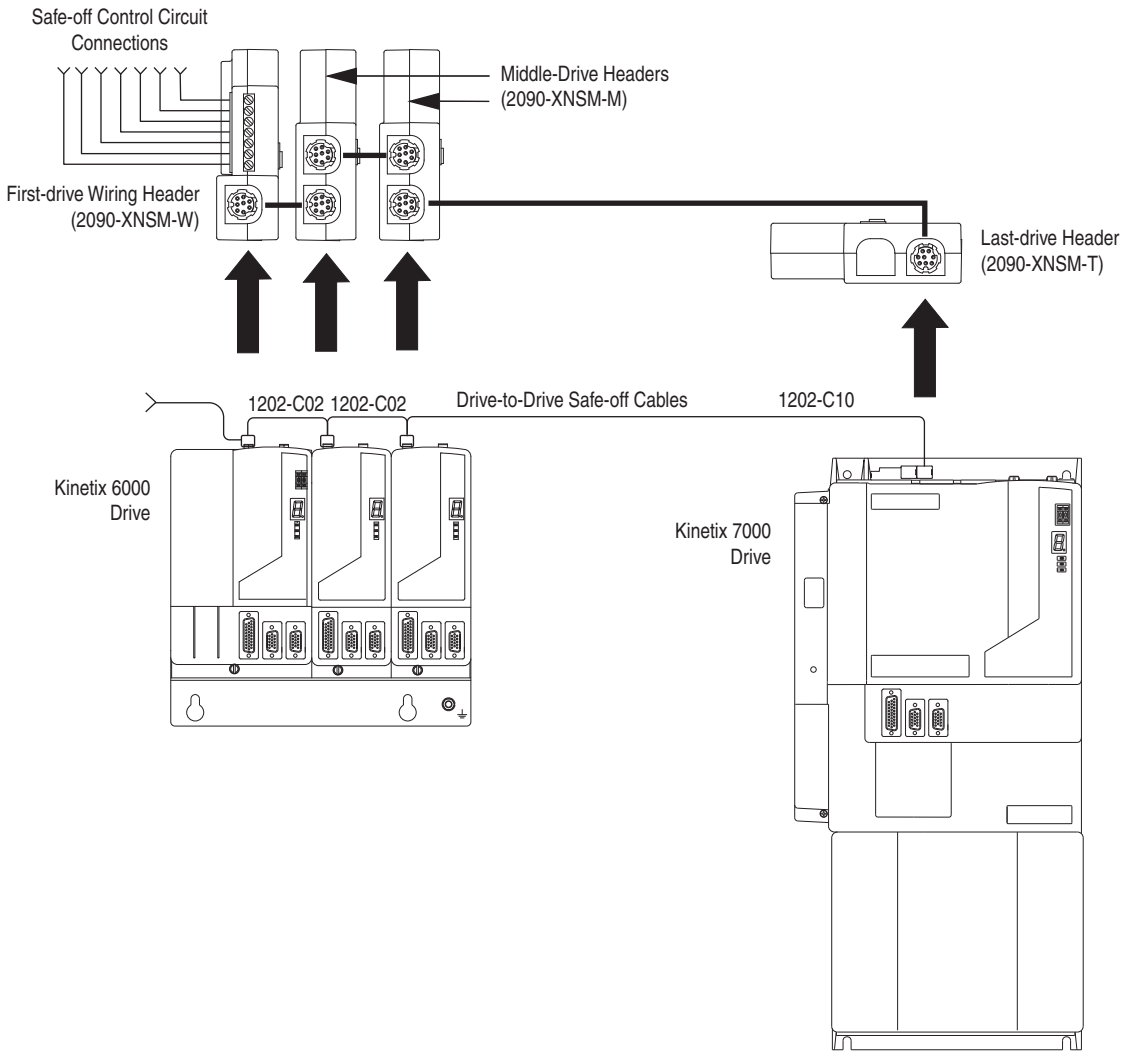
Safe-off Multi-Axis Configuration

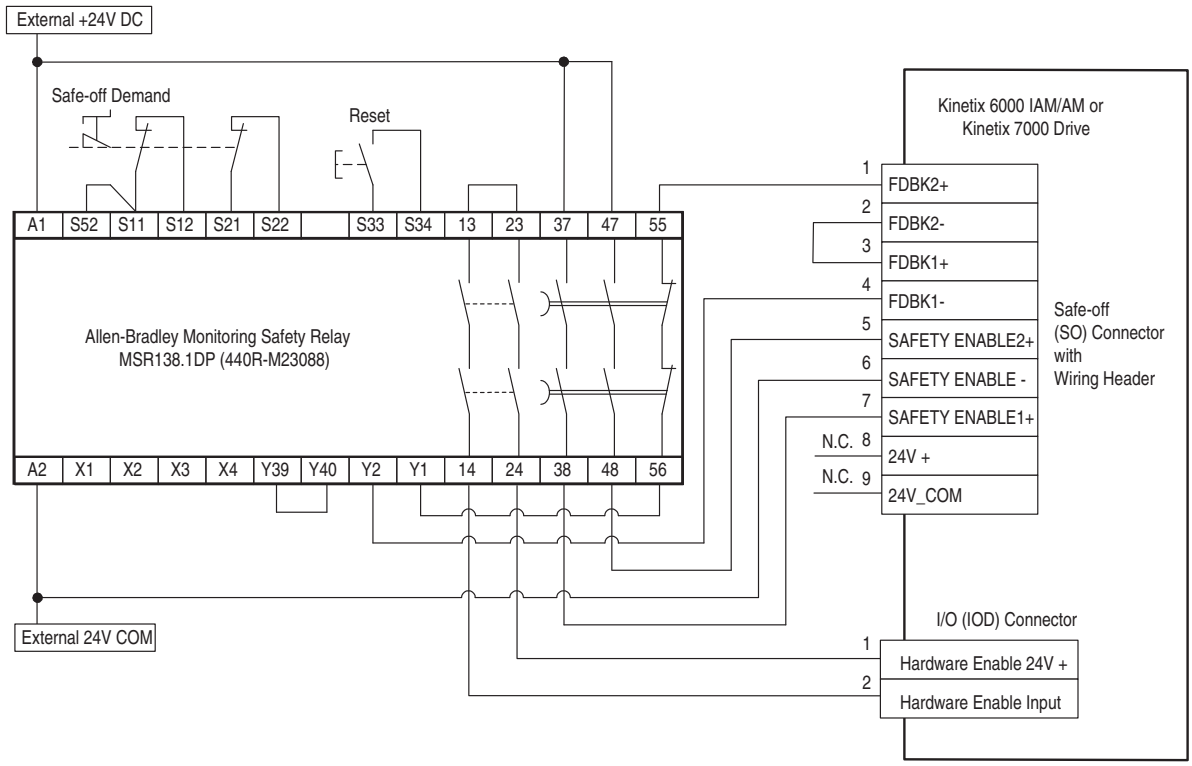
Kinetix 6000 to Kinetix 7000 Safe-off Multi-Axis Configuration



Stop Category 1 Configuration (Kinetix 6000 or Kinetix 7000)

Single-Axis Relay Configuration

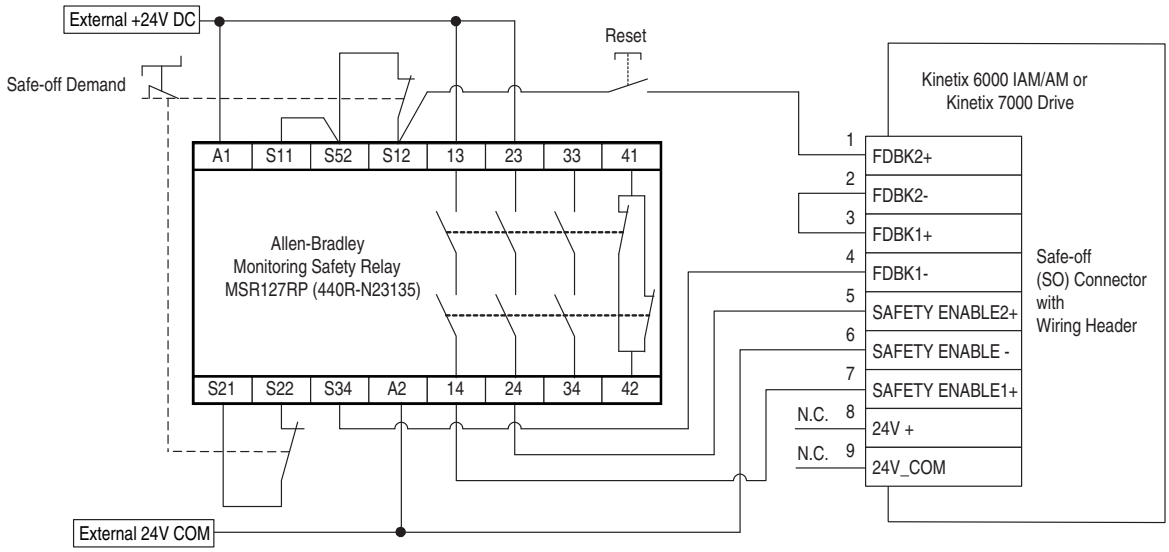
The Kinetix 6000 or Kinetix 7000 drive Safe-off connector is wired to an Allen-Bradley safety relay. The proper configuration in RSLogix™ 5000 software is required.



Stop Category 0 Configuration (Kinetix 6000 or Kinetix 7000)

Single-Axis Relay Configuration

The Kinetix 6000 or Kinetix 7000 drive Safe-off connector is wired to an Allen-Bradley safety relay.



You can use an Allen-Bradley GuardPLC™ or GuardLogix® controller instead of the safety relay to provide the safety logic for more complex safety systems.

Accessories

Safe-off Headers for Kinetix 6000 or Kinetix 7000 Drives

Description	Cat. No.
Safe-off wiring header for the first drive in multiple safety drive configurations (optional)	2090-XNSM-W
Safe-off middle header for the first drive-to-drive connections in multiple safety drive configurations with three or more drives (optional)	2090-XNSM-M
Safe-off terminating header for the last in multiple safety drive configurations (optional)	2090-XNSM-T

Safe-off Interface Cables for Kinetix 6000 or Kinetix 7000 Drives

Safe-off interface cables are required for making connections with 2090-XNSM-W, -M, and -T headers.

Description	Cat. No.
Drive-to-drive safety cable, 200 mm (7.9 in.), for connecting single-wide Kinetix 6000 modules.	1202-C02
Drive-to-drive safety cable, 350 mm (13.8 in.), for connecting double-wide Kinetix 6000 modules.	1202-C03
Drive-to-drive safety cable, 1050 mm (41.3 in.), for connections. • between Kinetix 6000 power rail and Kinetix 7000 drive. • between two Kinetix 6000 power rails. • between two Kinetix 7000 drives.	1202-C10

Because of the current capacity limitation of the Safe-off cable connectors, multiple Safe-off drive configurations must not exceed eight Kinetix 6000 or Kinetix 7000 drive modules.

The Allen-Bradley CENTERLINE ArcShield arc-resistant controller provides rugged process control for applications requiring a higher level of personnel protection. ArcShield products are compliant to the IEEE C37.20.7 standard, and provide Type 2 protection during an arc flash.

The ArcShield controller safely redirects the arc flash energy out the top of the unit and away from personnel. This level of protection is also maintained when the low voltage door is open for maintenance purposes.

The ArcShield products have a robust enclosure design which contain the arc flash energy and exhaust materials until vents on top of the enclosure open. Once opened, the vents provide a path for materials to exit the enclosure. An overhead plenum is used to direct the materials to a safe location, away from personnel near the equipment. The low voltage panel is reinforced and sealed, to prevent arc flash exhaust materials from entering this compartment.

As standard, a plenum exhaust section is provided with each new ArcShield order. The plenum exhaust section can be mounted on either the left or right end of the line-up, and it extends 1016 mm (40 in.) past the end of the line-up.

As the ArcShield may have an impact on horsepower ratings, please contact your local Rockwell Automation sales office or Allen-Bradley distributor to confirm.

Features

- Reinforced cabinet and power cell door closure mechanism
- Multi-point latching mechanism, reinforced cross bracing and gasket sealing
- Reinforced back plates — added support plates secured with multiple bolts increase rigidity and security
- Reinforced low voltage panel to withstand arc flash energy and shield maintenance personnel while working in the isolated low voltage compartment
- Arc “Pressure Relief” vent to direct gases and material away from personnel during an arc flash
- Available with removable arc exhaust plenum

CENTERLINE 2100 Motor Control Centers with ArcShield

Reduce your risk of arc flash injury through the use of the industry leading arc containment design, which has been tested to meet the arc resistant standards for medium voltage equipment, IEEE C37.20.7: IEEE Guide for Testing Medium-Voltage Metal- Enclosed Switchgear for Internal Arcing Faults.

ArcShield enhances the CENTERLINE 2100 Motor Control Center (MCC) and is the first low voltage MCC to offer arc-containing features. ArcShield helps provide you with Type 2 accessibility and improves protection for your personnel against internal arcing faults. With Type 2 accessibility, personnel are shielded at the front, rear and sides of the enclosure in the unlikely event of an arcing fault.

Arc resistant baffles for the CENTERLINE 2100 MCCs with ArcShield allow you to have an arc resistant MCC with a wider range of MCC units, even units that require venting, such as variable frequency drives (VFDs). Arc resistant baffles allow air flow to help dissipate the heat and still provide Type 2 accessibility.

CENTERLINE 2100 MCCs with ArcShield are available on the quick delivery program; allowing your order to go directly to the factory and ship in as little as four weeks.

Contain Arc Flashes

Arc-containment door latches help deliver an extra level of protection by allowing pressure relief and keeping the doors from detaching from the structure. Manual or automatic shutters and insulated bus covers help reduce fault propagation within your MCC. The lower horizontal bus ratings and incoming protection sized for your MCC, help reduce the amount of arc flash energy in your application. By containing an arc flash, your potential exposure to hazardous conditions can be reduced.

Reduce Electrical Shock Hazards

CENTERLINE 2100 MCCs are designed to enhance safe operation by helping isolate you from potentially hazardous voltages by providing a solid grounding system and helping minimize potential electrical shock hazards. Additional options such as IntelliCENTER® software, DeviceNet™ ports, blown fuse indicators, exterior windows on unit doors, infrared inspection ports and finger-safe component barriers can help you create a safer working environment by reducing your potential to make contact with energized components.

CENTERLINE 2500 Motor Control Centers with ArcShield

The CENTERLINE 2500 MCC is designed to meet the needs of your global facilities operating in Latin America, Asia, Europe and other areas of the world where motor control centers must meet IEC standards. With more intelligent components and more options than other MCC manufacturers, you get a total power, control and information solution packaged for your local specifications, built on a common platform.

CENTERLINE 2500 MCCs with ArcShield offers you better protection against harmful arc flash hazards. Using a CENTERLINE 2500 MCC with ArcShield helps protect your personnel if an arc flash were to occur within an MCC.

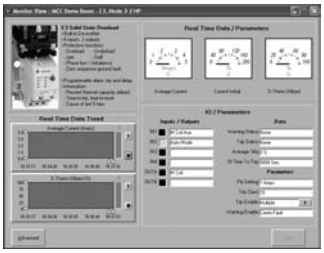
CENTERLINE 2500 MCC with ArcShield provides personnel and assembly protection per IEC/TR 61641:2008 for arcing durations up to 300 ms (available for systems at 415V (max), with 65 kA (max) available current).

In combination with the standard safety features built into every CENTERLINE 2500 MCC, choosing ArcShield provides additional benefits, including:

- Enclosures with no front ventilation
- Pressure relief system designed to exhaust gases through the top of the enclosure, away from personnel
- Arc containment latches on all doors capable of withstanding the high internal pressure generated by an arc blast
- Insulated power bus closing plates included at the ends of each MCC lineup
- For even more protection, optical and current sensing technology for use with crowbar or shunt trip devices is available as an option.

IntelliCENTER Technology

Minimize Entry into Arc Flash Boundary



IntelliCENTER technology helps enhance personnel safety

- Advanced diagnostics of IntelliCENTER software provide remote access to your MCC data for troubleshooting, minimizing your need for entry in the arc flash boundary zone
- With the ability to remotely monitor MCC, you can perform many routine maintenance tasks without "suiting up," reducing personnel exposure to hazardous energy levels
- IntelliCENTER Software can warn of failures before they occur – increasing your ability to respond proactively before a hazardous situation occurs

Low Voltage Arc Resistant Motor Control Center Specifications

		CENTERLINE 2100 Motor Control Center with ArcShield		CENTERLINE 2500 Motor Control Center with ArcShield
General	Enclosure Types	NEMA 1, 1G, 3R, 4, 12		IP 20, 40, 42, 54
	Section Height	2286 mm (90 in.)		2300 mm (91 in.)
	Section Width (for plug-in units)	508 mm (20 in.) - 635 mm (25 in.) available with 229 mm (9 in.) wireway		700, 800, 900 or 1000 mm (28, 32, 36, or 40 in.)
	Section Load Capacity	600 or 1200 A		600 or 1200 A
	Arc Resistant Rating	**Device Limited**	**Arc Duration 100 ms or less**	N/A
	Rated Voltage	600V	480V	up to 690V
	Horizontal Bus Current Rating	600…1200 A	600…3000 A	800…3200 A
	Section Depth (for plug-in units)	381 or 508 mm (15 or 20 in.)	508 mm (20 in.)	600 or 800 mm (24 or 32 in.)
	Short Circuit Withstand Rating	42000 or 65000 A rms symmetrical		Up to 65000 A rms symmetrical
Available Equipment for MCC Units	Full Voltage Non-reversing Starters	Yes		Yes

Bulletin 100S/104S Safety Contactors

Bulletin 100S-C/104S-C safety contactors provide mechanically linked positively guided contacts, required in feedback circuits of modern safety applications. The mechanically linked N.C. auxiliary contacts will not change state when a power pole welds. In addition, the gold-plated bifurcated auxiliary contacts are ideally suited for low-energy applications or feedback control circuits with multiple series-connected N.C. auxiliary contacts.

- Mechanically linked N.C. auxiliary contacts
- Front-mounted auxiliary contacts:
  Gold bifurcated
  Permanently fixed
  Protective cover to prevent manual operation
  Red contact housing foreasy identification
  Incorporates IEC 60947-5-1 “Mechanically Linked” or IEC 60947-4-1 "Mirror Contact" symbol
- AC and DC operating coils
- SUVA Third-Party certification

Standards Compliance

EN50205
CSA C22.2 No. 14
UL 508
EN/IEC 60947-4
IEC 60947-4-1 Annex H — Mirror Contacts
IEC 60947-5-1 Annex L — Mechanically Linked Contacts

Certifications

SUVA Third-Party Certified
CE Marked
cULus Listed (File No. E3125;
Guide NLDX, NLDX7)

Your order must include: cat. no. of the contactor specified with coil voltage code and, if required, cat. no. of any accessories and/or replacement coils.

∗ Must be ordered in package quantities.
❄ 16 mm² max. according to IEC 60947; actual max. 25 mm².

Bulletin 100S-D Safety Contactors

Bulletin 100S-D safety contactors were designed to address the needs of modern safety applications requiring feedback and monitoring of the energy isolating switchgear used in hazardous motion loads. The 100S-D meets these needs through its "mirror contact" design. If a power contact welds, the N.C. auxiliary contacts will not change state. This feature provides reliable indication about the open/closed status of the main power poles. In addition, the gold-plated bifurcated auxiliary contacts are ideally suited for low-energy applications or feedback control circuits with multiple series-connected N.C. auxiliary contacts.

- 63…500 kW @400V
- 75…600 Hp @460V
- 100…700 Hp @575V
- Electronic and conventional coils
  - AC & DC
  - Integrated PLC interface
  - Low power pick-up & hold-in
  - Wide voltage ranges
- Complete range of accessories
- Environmentally friendly
- Compact dimensions

Standards Compliance

IEC 60947-4-1
IEC 60947-4 Annex F
IEC 60947 Type “2” Coordination
CSA C22.2 No. 14
UL 508

Certifications

CE Marked
cULus Listed (File No. E 41850, Guide NLDX, NLDX7)
SUVA Certified

Your order must include: cat. no. of the contactor specified with coil voltage code and, if required, cat. no. of any accessories and/or replacement coils.

∗ Electronic coil drives are designed to minimize power requirements, but this control may exhibit a higher inrush (540 W, < 10 ms) when energizing. This must be taken into account for the proper sizing of supply devices, all-or-nothing relays and cross-sections of coil supply lines. Please contact your local Rockwell Automation sales office or Allen-Bradley distributor for detailed information.

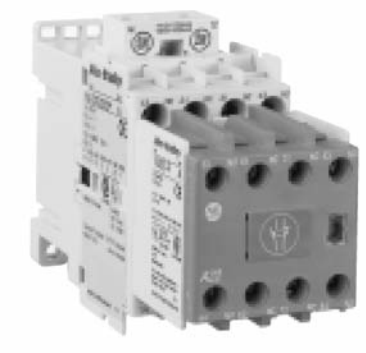
Safety Control Relays

Bulletin 700S-CF



Description

Bulletin 700S-CF Safety Control Relays provide mechanically or mirror contact performance, which are required in feedback circuits for safety applications. Bifurcated contacts are ideal for low energy feedback safety dircuits where high contact reliability is required.

Features

- IEC industrial safety relay
- Mechanically linked contacts as per IEC 60947-5-1
- Third party certification SUVA
- Red cover and mechanically linked contact symbol on front face
- Gold plated, bifurcated version for low level switching applications
- Permanently fixed front mounted auxiliary contact block

Standards Compliance

EN/IEC 60947-1, -5-1
UL 508
CSA C22.2 No. 14

Certifications

cULus Listed (File No. E14840, Guide NKCR/NKCR7)
CE Marked

DC Safety Control Relays

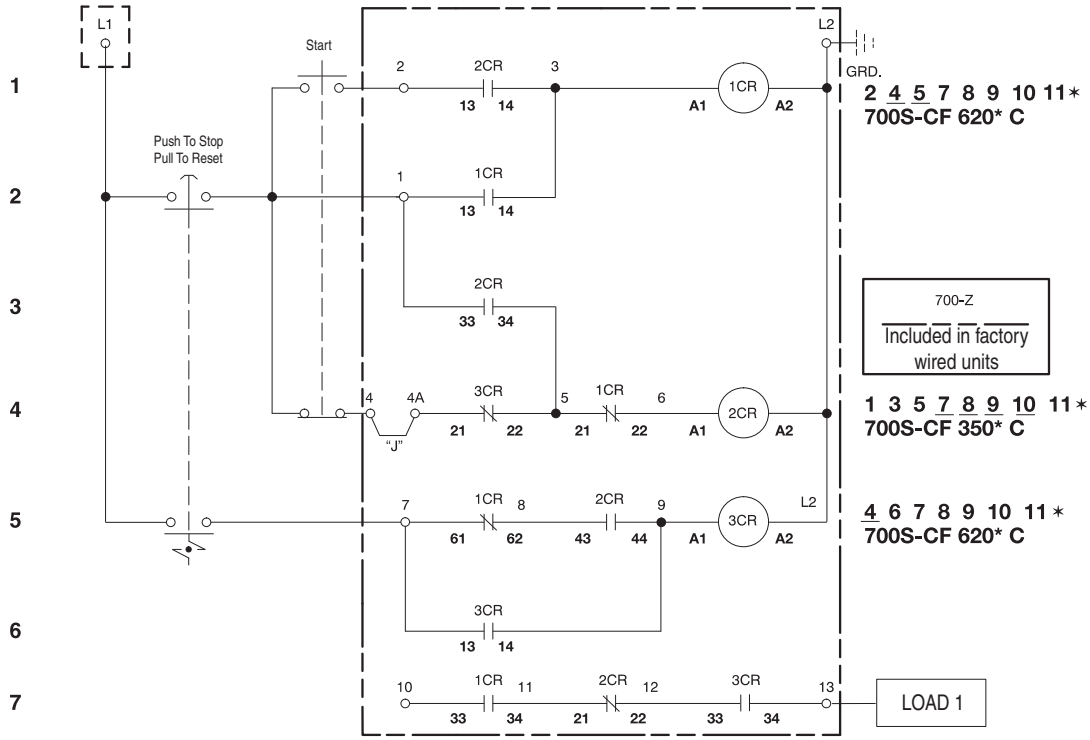
Safety Relay Circuit With 5 Safety Outputs

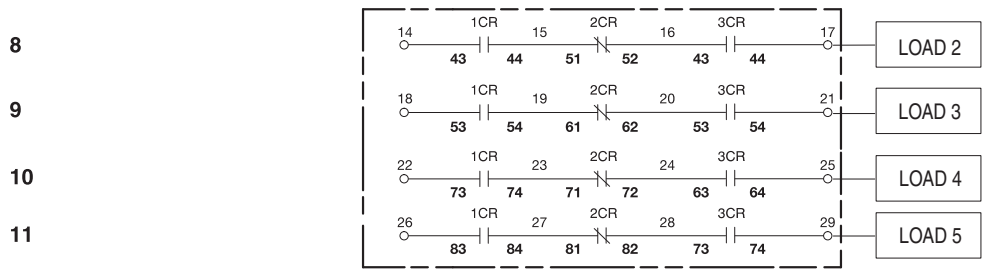
- Use for E-stop control. E-stop will work properly if any one fault occurs (a fault could be one welded contact or one undesired open connection such as a loose wire).
- High output switching capability and long contact life.
- Circuit complies with EN 954 categories 1, 2, 3, 4.
- Helps prevent restart of the 5 safety outputs if there is a single fault anywhere in the system.
- Use (3) 700S-CF relays and this diagram to construct the circuit

Basic Circuit
(1) Output Circuit (3 Relays, 9 Terminal Blocks)

Basic Circuit
(1) Output Circuit (3 Relays, 9 Terminal Blocks)



(5) Output Circuit (3 Relays, 17 Terminal Blocks)



* Numbers shown are the line numbers where the contacts for this relay appear.
Contact your local Rockwell Automation sales office or Allen-Bradley distributor for availability.

Features

- Mechanically linked contacts meet IEC 947-5-1-L
- 2…12 poles – all mechanically linked
- Red cover for easy identification of safety circuits
- Tamper resistant cover helps prevent changes which could jeopardize safety
- IEC mechanically linked contacts symbol displayed on front
- Visual indication of contact state
- Ideal for use in safety circuits

⊗AC Coil Voltage Code

The Cat. No. as listed is incomplete. Select a coil voltage code from the table below to complete the Cat. No.
Example: **Cat. No. 700S-P310** becomes **Cat. No. 700S-P310A1** for a 120V AC coil.

[V]	24	115...120	230...240	460...480
60 Hz	A24	**A1**	A2	A4

∗ For other coil voltages, consult your local Rockwell Automation sales office or Allen-Bradley distributor.

IEC 947-5-1 Annex L has 2 requirements for a relay to meet for mechanically linked contacts:
1.) If a N.O. contact welds, all the N.C. contacts will remain open and meet a 2500V impulse test.
2.) If a N.C. contact welds, all the N.O. contacts will remain open and meet a 2500V impulse test.
Bul. Nos. 700S-P and 700S-DCP relays meet these requirements including the 2500V impulse test.
The relays shown on this page are shipped from the factory with the Bul. 700-CPS safety cartridge installed and cannot be converted to N.O. or N.C. in the Field.

Safety Starter

Bulletin 109S

Description

The Bulletin 109S Safety Starter combines many features of the standard Bulletin 109 Enclosed Starter with a redundant contactor. The redundant safety contactor makes the Bulletin 109S suitable for use in Category 3 and 4 safety circuits. The safety circuit interface is designed to work with Safety Monitoring Relays, Safety PLC and GuardLogix, allowing the typical safety circuit to control higher switching currents and motor loads (9…860 A). This makes the safety system integration quicker and easier to apply by using a modular approach to the safety solution.

Features

- Positive-guided auxiliary contacts (9…85 A) and mirrored auxiliary contacts (95…860 A)
- 24V DC or 120V AC (50/60 Hz) control voltage
- Cover-mounted green pilot light (illuminated when output is on)
- Up to 600V line voltage
- Options similar to the standard Bulletin 109 enclosed starters
- Optional overload relay (E1 Plus and E3)

Specifications

Input Line Voltage Range	600V AC maximum
Control Voltage Range	24V DC or 110/120V AC (50/60 Hz)
Enclosure Rating	Type 12 (IP54) Open frame
System Operational Limits	+10%, -15% of the line voltage
Estimated Component Life	1,000,000 operations
Storage Temperature [C (F)]	-40…+80° (-40…176°)
Operating Temperature, Ambient—C (F)	-25…+40° (-13…104°)
Relative Humidity	90% noncondensing
Approvals	CE Marked for all applicable directives cULus
Standards/Certifications	Redundant contactors suitable for use in Category 3 or 4 systems UL 508A

Description

The Bulletin 2041 Safety Power Control combines safety circuits and power control of the redundant contactors and a safety relay. The Bulletin 2041 is TÜV certified for category 4 safety circuits. The safety circuit interface is designed to work with either light curtain outputs or safety interlock switches. The Bulletin 2041 also interfaces with Safety Monitoring Relays, Safety PLC, and GuardLogix solutions to allow for control of power circuits from 9…860 A at 600V maximum. This makes system integration quicker and easier by using a modular approach to the safety solution.

Features

- Positive-guided auxiliary contacts (9…85 A) and mirrored auxiliary contacts (95…860 A)
- 24V DC or 120V AC (50/60 Hz) control voltage
- Cover-mounted green pilot light (illuminated when output is on)
- Up to 600V line voltage
- Optional overload relay (E1 Plus and E3)

Typical System

Description

The ElectroGuard system is designed to simplify the Lock Out/Tag Out (LOTO) task performed by a machine operator or maintenance personnel. The ElectroGuard system can control single or multiple energy sources simultaneously. Simplifying the procedure helps increase the likelihood that personnel will perform the LOTO on large processors or drive systems.

The ElectroGuard system can be configured with modules to provide:

- Electrical energy isolation (ElectroGuard Power Panel).
- Pneumatic energy isolation (Pneumatic Isolation Module).
- Hydraulic energy isolation (Hydraulic Isolation Module).
- Multiple lockout points (Remote Lockout Stations).
- Control of multiple systems (System Multiplexer/Permissive or Dual RLS).
- Interface to safety-gate interlocks (Verification Module).

The ElectroGuard allows the system engineer to design LOTO into the system. Locating the Remote Lockout Stations (RLS) at hazard entry points can result in the shortest down time during set-up or maintenance.

Standard Features

- System is designed to prevent accumulation of faults.
- Standard system provides for four RLS on the 23…85 A systems and up to six RLS on the 110…1200 A systems.
- Verification light on the RLS (no light means no entry).
- Meets International Standard EN 954-1/ISO 13849-1, TÜV certified Category 4 system.
- Pneumatic and hydraulic ready.

Optional Features

- Expansion modules allow for additional RLS connections.
- Pneumatic and hydraulic energy isolation.
- System multiplexer/permissive module allows for control of multiple energy sources simultaneously.
- Network communication option provides the control system with status.

Specifications

Certifications	cULus TÜV Rheinland Certified CE marked for all applicable directives
Standards	IEC/EN 60204-1 IEC/EN 60439-1 Category 4 to EN 954-1/ISO 13849-1 98/37/EC Machinery Directive 89/336/EC EMC Directive 73/23/EC Low Voltage Directive UL508A
Estimated Component Life Remote Lockout Station Power Contactors (Isolation & Grounding)	23… 85 A: 2,000,000 operations 110…1200 A: 1,000,000 operations
Storage Temperature [C (F)]	-10…+60° (14…140°)
Operating Temperature [C (F)]	0…+40° (32…104°)
Relative Humidity (noncondensing)	90% (Ambient)
Power Panel Construction	NEMA Type 12/IP54 UL Type 4/IP66 UL Type 4x MCC (Bulletin 2100) with and without Bus
Expansion Module Construction	4-port: Supports up to 4 remote lockout stations 10 port: Supports up to 10 remote lockout stations
Safety Isolation System Inputs	Remote Lockout Stations
Input Options	Safety Mats, Light Curtains, and E-Stop Stations
System Operational Limits	+10%, -15% of the line voltage

Sequence of Operation

After using the normal stopping method of the machine or process, the machine operator turns a Remote Lockout Station (RLS) handle from the ON to the OFF position.

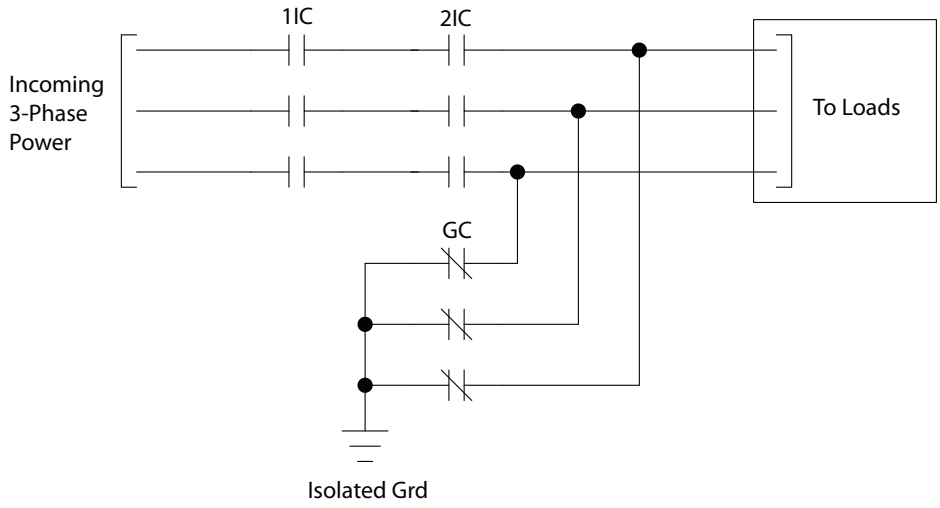
The RLS signals the:

1. Isolation contactors (1IC and 2IC) to drop out, isolating the supply voltage from the loads (see Power Circuit below).

2. The grounding contactor (GC) is then energized, connecting the load to ground (see Power Circuit). The grounding contactor and the isolation contactors are both electrically and mechanically interlocked.

3. The System Isolated light will then illuminate on the RLS to indicate the system is isolated.

4. The person performing the LOTO then applies a lock to the RLS, locking it in the OFF position. The equipment is now locked out.



Power Circuit

Communication

The optional Communication Module allows the ElectroGuard system to communicate status to the process or machine control system. Although the communication module can be field installed, it is recommended that this option be ordered as part of the ElectroGuard system. The customer is responsible for configuring and programming their control system to receive the status signals from the ElectroGuard.

Status signals available:
- Overall system status
- Remote lockout station (status of each station)
- Pneumatic or hydraulic isolation modules (if used)
- Other optional safety input devices

Current networks available*:
- DeviceNet™
- Remote I/O
- ControlNet™
- Ethernet IP
- PROFIBUS

See the ElectroGuard or accessories for ordering instructions.

IMPORTANT	The communication option allows a remote PLC to receive status signals from the ElectroGuard safety isolation system.

Door Mounted Metering

Optional door mounted ampere meter, volt meter, or both, are available as factory installed options. They provide visual indication of line side system current and voltage. See the ElectroGuard or accessories for ordering instructions.

Expansion Module

Expansion Modules are used to add more Remote Lockout Stations in addition to the base inputs (four remote lockout stations for 23…85 A units and six for the 110…1200 A systems). See expansion module section for details.

Multiplexer and Multiplexer Permissive

The Multiplexer Module allows the Remote Lockout Station to control two or more ElectroGuard systems. The permissive function allows the equipment control system to determine if the ElectroGuard can be locked out. See Multiplexer and Multiplexer Permissive section for sequence of operation and details.

IMPORTANT	Only one of these options can be installed in the power panel, and are not available on the 23…85 A units, or 2031-A0630JX or 2031-A860JX units.

Product Selection

ElectroGuard cat. nos. can be configured by selecting the appropriate codes from the tables below.

1-1/2 in. Pneumatic Isolation Module

Pneumatic Isolation Module

The ElectroGuard Safety Isolation System is available with an optional means of isolating the pneumatic energy source for the machine or process. The Pneumatic Isolation Module is designed to work in conjunction with the power panel. This option blocks the pneumatic line leading to the pneumatic hazard. The valve then bleeds or dumps the residual pneumatic energy leading to the machine. After the valve is in the blocked position and the pressure drops to less than five psi (pounds per square inch), a signal is sent to the power panel indicating the pneumatic energy is isolated. The system isolated light, located on the Remote Lockout Station (RLS) that was switched to the OFF position, is then illuminated.

Hydraulic Isolation Module

Hydraulic Isolation Module

The ElectroGuard Safety Isolation System is available with an optional means of isolating the hydraulic energy source for the machine or process. The Hydraulic Isolation Module is designed to work in conjunction with the power panel. The valve blocks the hydraulic line leading to the hydraulic hazard. Then the residual hydraulic energy is returned to the tank. After the valve is in the blocked position and the pressure drops to less than 100 psi (pounds per square inch), a signal is sent to the power panel indicating the hydraulic energy is isolated. The system isolated light, located on the RLS that was switched to the OFF position, is then illuminated.

4-Port Expansion Module

Optional Expansion Module

Optional Expansion Modules are available for applications requiring more than the maximum allowable Remote Lockout Stations (RLS) (e.g. more than four for 23…85 A systems or more than six for 110…1200 A systems). The Expansion Modules are available in 4- or 10-port configurations. This allows up to four RLSs for a 4-port and ten RLSs for a 10-port module. An example would be adding a 4-port expansion module to a 23A ElectroGuard. This then allows up to seven RLSs to connect to the system.

Expansion Modules may be ordered with an adjustable time-delay feature (1…30 seconds) in order to allow time for the machine operator to shut down drives or other equipment that requires a controlled stop after a RLS handle has been turned to the OFF position. Consult your Rockwell Automation sales office or Allen-Bradley distributor for other time settings. Enclosed Expansion Modules are available with optional Flex modules to provide status communication to a remote PLC. Communication can be via ethernet, ControlNet, DeviceNet, Profibus or Remote I/O.

NOTE: The status communication option allows a remote PLC to receive status signals from the Expansion Module.

Remote Lockout Station

Remote Lockout Station

The Remote Lockout Station (RLS) is a key component of the ElectroGuard system. The RLS is typically located at the hazard location and provides the signal to the power panel to initiate the LOTO process. The RLS is available in several configuration and enclosure types.

Dual Remote Lockout Station

The Dual Remote Lockout Station functions the same as a single or standard Remote Lockout Station. The difference between a single and a dual RLS is that the dual RLS can be used to control two ElectroGuard systems from the same RLS. A good example of this is a machine that has two separate incoming power sources. Using a dual RLS and two ElectroGuard both ElectroGuard can be controlled from the same station.

Verification Module

The optional Verification Module (VM) is connected between the solenoid locking safety switch, similar to a Guardmaster Atlas™ 5 and the Remote Lockout Station (RLS) input on an ElectroGuard system. When the VM receives the system isolated signal from the ElectroGuard, the VM provides the signal to the solenoid on the Atlas 5, unlocking the Atlas 5 and allowing access to the machine.

Once the Atlas 5 is unlocked, the VM provides a redundant signal to the ElectroGuard emulating a RLS that has been switched to the OFF position. The emulated signal is then switched to the on state, to indicate the gate has been closed. If all of the RLSs connected to the ElectroGuard are switched to the ON position and the safety gate is closed, the ElectroGuard will attempt to lock the gate and restore energy the machine. If the verification module has not verified the gate is locked, the energy is removed from the machine and the locking process is repeated.

Specifications

Dry Contact (B300 6A/125V AC or P300 3A/24V DC) provided to control solenoid voltage.

Multiplexer/Permissive Module

When multiple energy sources must be controlled simultaneously or the system must be stopped at a pre-determined stopping point, the LOTO process becomes more complicated with multi-step procedures and locks. The Hydraulic/Pneumatic Multiplexer and the system Multiplexer/Permissive Module were developed to help provide simultaneous control of multiple hazards from a single lockout point.

Coordination between the process or drive system control and the LOTO process, is a concern. In a typical system, a signal from the LOTO device is sent to the control system. This provides indication that the device has been switched to the OFF position. This requires the person switching the device to ensure the process or machine has stopped. Ideally this would be coordinated so the power is not disconnected until the process or drive system is at an acceptable stopping point. The addition of the Permissive function to the System Multiplexer allows the control system to signal the ElectroGuard system when it is at the desired stopping point. This function would only allow the stopping function (i.e., the control system can not restore power). That function can only be accomplished via the RLSs attached to the System Multiplexer/Permissive Module.

The diagram below depicts a system with multiple motors or drives that require a synchronized lockout. This system also requires that the power to the drives must be maintained during certain phases of the process. The control system is interfaced with the ElectroGuard systems via the Permissive option in the System Multiplexer/Permissive Module. This allows the control system to delay disconnecting power until the drives are at an allowable point in the process.

Functional Description

The System Multiplexer Module allows a Remote Lockout Station (RLS) to control up to four ElectroGuard systems simultaneously. The System Multiplexer Module will accept up to six RLS inputs. If there is a need to control more than four ElectroGuard systems, the System Multiplexer Modules can be daisy-chained as shown in the drawing below. For applications where more than four RLSs are required, an expansion module may be used.

The System Multiplexer Module is also available with a Permissive option. The Permissive option allows the machine controlling the process or drive system to bring the machine or process to a pre-determined stopping point prior to removal of power by the ElectroGuard system. Once the ElectroGuard system isolates the energy, the machine control can not re-energize the ElectroGuard.

SYSP	EG system with permissive option
HPM	Hydraulic/pneumatic module

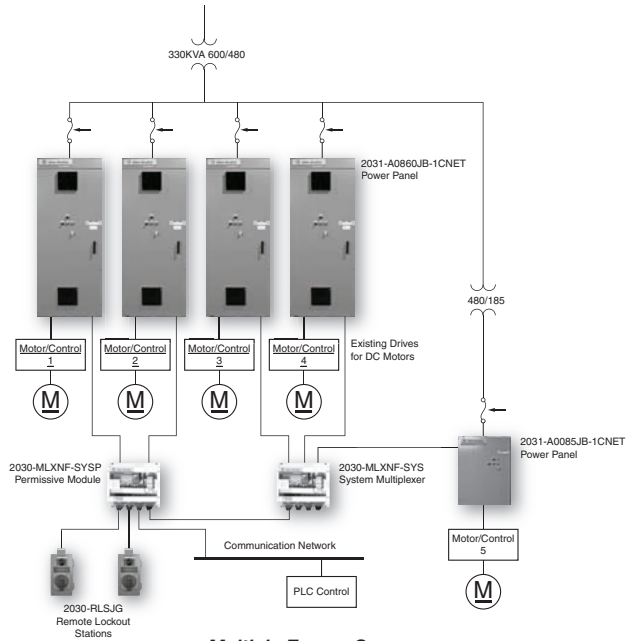
Sequence of Events for System Multiplexer Module:

1. When a RLS is turned OFF, the outputs of the System Multiplexer Module are switched to the off or open state, see diagram below.
2. This signal is connected to the input of the ElectroGuard systems initiating the isolation process.
3. When all of the ElectroGuard systems are in the isolated state the System Multiplexer Module sends the Isolated signal to the RLS and the RLS System Isolated pilot light will be illuminated.

Sequence of Events for System Multiplexer Module with Permissive Option:

1. A PLC output is connected to the System Multiplexer/Permissive Module. This signal is used by the System Multiplexer/Permissive Module as a heart beat. This holds the output of the System Multiplexer/Permissive Module in the on or closed state, holding the ElectroGuard system in the on or non-isolated state.
2. When a RLS is turned OFF, a signal is transmitted to the control system via a PLC connection on the RLS auxiliary contacts, see diagram below. Note that the outputs of the System Multiplexer/Permissive Module remain in the on or closed state.
3. When the customer's control system is at a predetermined stopping point, the control system, via the PLC output, is turned to an off state (no heart beat) and the outputs of the System Multiplexer/Permissive Module are then switched to the off or open state.
4. The system isolation function is then initiated on all of the ElectroGuard systems simultaneously.
5. When all of the ElectroGuard systems are in the isolated state, the System Multiplexer/Permissive Module sends the Isolated signal to the RLS and the RLS System Isolated pilot light on the RLS will be illuminated. The RLS now has control of the ElectroGuard and the energy can only be restored to the machine or process by switching all of the RLSs connected to the multiplexers to the on state.

   NOTE: Modification to the logic in the customer's control system is required if the Permissive option is used. See user manual for details.



Multiple Energy Sources

System Selection Process

1. Determine the catalog number of the Safety Isolation System based on the rating of the load(s) to which it will be connected as follows:
   — If the Safety Isolation System is connected to a single motor load, the horsepower or kilowatt rating of the system should be determined as follows:
   a. Select the Safety Isolation System that meets or exceeds the horsepower or kilowatt rating of the load at the required voltage and frequency.
   — If the Safety Isolation System is connected to two or more motors or one or more motors in combination with other loads; the horsepower or kilowatt rating of the system should be determined as follows:
   b. Identify the types of loads (i.e. motor, resistive) and the values of the currents of each of the loads (i.e. steady-state current for resistive loads, full-load and locked-rotor currents for motor loads) to be connected to the Safety Isolation System.
   c. Sum the full-load currents of all the motor loads to be connected to the Safety Isolation System. To this value add the current values of all resistive loads to be connected to the Safety Isolation System. This value is the combined load full-load current.
   d. Find the horsepower or kilowatt rating of a single motor with a full-load current value greater than or equal to the combined load full-load current value determined in step b.
   e. Select the Safety Isolation System that meets or exceeds this horsepower or kilowatt rating at the required voltage and frequency.
   f. Sum the locked-rotor currents of all the motor loads to be connected to the Safety Isolation System. To this value add the current values of all resistive loads to be connected to the Safety Isolation System. This value is the combined load locked-rotor current.
   g. Find the horsepower or kilowatt rating of a single motor with a locked-rotor current value greater than or equal to the combined load locked-rotor current value determined in step e.
   h. Select the Safety Isolation System that meets or exceeds this horsepower or kilowatt rating at the required voltage and frequency.
   i. Compare the ratings of the Safety Isolation Systems selected in steps d and g. Select the larger of the two systems for your application.
2. Determine how many Remote Lockout Stations are required for the application.
3. Determine how many Expansion Modules (if any) are required for the application.
4. Pick suitable enclosure type(s) for the Safety Isolation System Power Panel, Remote Lockout Stations and enclosed modules (e.g., Expansion Modules, Pneumatic and Hydraulic Isolation Module).
5. Determine what, if any, factory-installed options are required for the application (e.g. Pneumatic Isolation, Hydraulic Isolation, Status Communication to remote PLC, metering).

Bulletin 194E IEC Load Switches

Description

Bulletin 194E load switches are designed for use as local motor isolation and disconnect switch applications. Available with 3- and 6-pole versions with add-on additional poles, grounding and neutral terminals and auxiliary contacts, Bulletin 194Es share the same operating handles as the Bulletin 194L Control and Load Switches. Bulletin 194E switches are offered in two mounting styles, Front/Door and Base/DIN configurations for a variety of installations. Switch body styles for Bulletin 194E base-mounted switches include standard interlock shaft; Bulletin 194E front-mounted switches include standard shaft. Two-position OFF-ON switch is used to connect or disconnect a variety of inductive loads, including solenoids, valves, magnetic starters, relays, and motors. Handles featuring marked legend plates are available in Selector-Knob, Disk-Style, Rectangular-Style and Key-Operated versions. Selector-Knob versions are available in three sizes. Most handles are available in colors of Grey/Black or Red/Yellow and have padlockable versions.

- Suitable as At-Motor Disconnect Switch (UL508)
- 16, 25, 32, 40, 63, 80, 100 A Inductive Load-Rated Switches
- IP66/ UL Type 1/3/3R/12 Operating Handles
- IP2LX Finger-Safe Terminals
- 3- and 6-Pole Versions; Add-on Accessory Poles to Make 4-, 5-, 7- and 8-Pole Units
- Front/Door or DIN/Base Mounting Configurations
- Available in OFF-ON and Changeover Configurations
- 3- and 6-Pole Enclosed Switches
- Optional Thermoplastic Enclosures
- Positive-Guided Actuation
- Padlockable Handles Available (up to 3 padlocks)

Accessory Configuration Guidelines

Accessory drawings represent modular, snap-on features of Bulletin 194E accessories. They are not suggesting possible accessory configurations. Use the following guidelines for choosing 194E accessory configurations.

- Up to two accessories may be added to the Bulletin 194E switch body.
- For the 194E 25, 32, 40, or 63 A switches, the early break auxiliary contact (-PD10) may only be used in the following configurations:
  As a single unit on either side of the switch
  As a single unit on a side when used with a switch + 4th pole (-NP)
  As a single unit on a side when used with a switch + ground terminal (-PE)
  As a single unit on a side when used with a switch + neutral terminal (-TN)
  No other auxiliary contact may be used in combinations with an early break auxiliary contact (-PD10)
- Other combinations of auxiliary contacts are permissable.
- For the 194E 80 and 100 A switches, any combination of auxiliary contacts, 4th pole, ground terminal, neutral terminal, and -PD10 is permissable.

230…350 mm (9-3/64…13-51/64 in.)			194L-G3394

Metal Shaft Adaptor Kits — For use with 194R Type 4/4X Handles

	For Use With	Pkg. Qty.	Cat. No.
Metal shaft adaptor kits — for use with 194R Type 4/4X handles kit includes bezel adapter and 194R-R1 operating shaft. Operating handle (Cat. No. 194R-HS4) must be ordered separately.	194E-A…	1	**194E-G3675**
Metal Shaft Extension For modification of Cat. No. 194L-G3393/ G3394 when used with any switches other than 2-position, 90° rotation.	194E-A…	10	**194L-G3399**

Other Accessories

194L/194E 22.5 mm Mounting Hole Style Handles (Type B, D) (For Front-Mounted Switches)

	Description		Cat. No.
Type B	22.5 mm Mounting Hole Style Handles (IP65) Handle Style: Knob Lever with Latch (For Use With 194E-E25…100 A, -1753) or 194L-E12…40 A		194L-HCB-001
Type D	22.5 mm Mounting Hole Style Handles Key Removal Position (Includes Latch) For Use With 194L-E 12…40 A, 194E-E16…63 A, -1753		194L-HCDC-001
	22.5 mm Mounting Hole Style Handles Key Removal Position (Includes Latch) For Use With 194L-E 12…40 A, 194E-E16…63 A, -1753		194L-HCDD-001
	22.5 mm Mounting Hole Style Handles Key Removal Position (Includes Latch) For Use With 194L-E 12…40 A, 194E-E16…63 A, -1753		194L-HCDG-001

Accessory Description		Pkg. Qty.	Cat. No.
	Control Knob, Black, with Locking Facility (Use 1/4 in. max. hasp lock.) (Locks in 0°, 90°, 180°, and 270° positions)	10	**194L-G2864N**
	Control Knob, Red, with Locking Facility (Use 1/4 in. max. hasp lock)		**194L-G2864R**

Accessory Description			Pkg. Qty.	Cat. No.
		Control Knob, Type P Control Knob, Black, 31 mm (1-7/32 in.) Diameter	5	**194L-G2888N**
		Control Knobs, Type P Control Knob, Red, 31 mm (1-7/32 in.) Diameter		**194L-G2888R**
Standard Black Control Knob	 *Rectangular Front Frame*	Control Knob, Black, L = 37.5 mm (1-31/64 in.)	5	**194L-G3154N**
		Control Knob, Black, L = 48 mm (1-57/64 in.)		**194L-G3155N**

Bulletin 194E IEC Load Switches

Bulletin 194E load switches are designed for use as local motor isolation and for disconnect switch applications. They are available in 3- and 4-pole versions with add-on grounding and neutral terminals and auxiliary contacts.

Bulletin 194E switches are offered in two mounting styles, Front/Door and Base/DIN configurations, for a variety of installations. Switch body styles for Bulletin 194E base-mounted switches include standard interlock shaft; Bulletin 194E front-mounted switches include standard shaft.

- At-Motor Disconnect Switch (UL508)
- 125, 160, 250, 315 A Versions of Inductive Load-Rated Switches
- IP66/UL Type 1/3/3R/12 Operating Handles
- IP2LX Finger-Safe Terminals
- 3- and 4-Pole Versions
- Front/Door or DIN/Base Mounting Configurations
- OFF-ON Configurations
- Box Lug and Bolt-on Terminals Available
- Switches Include Operating Shaft
- Suitable as Motor Disconnect

Overview

The Allen-Bradley Guardmaster® Safety Connection Systems are complete wiring solutions dedicated to machine safety. These quick disconnect-based systems consist of safety wired T-Ports and distribution boxes as well as patchcords and shorting plugs. Specifically intended for use with dry-contact safety switches, Safety Connection Systems provide flexible and reliable connections between safety interlock switches, E-stops, cable pull switches and safety relays. And while this system is ideal for use with these components, it is not suitable for use with light curtains, safety mats or pressure sensitive safety edges.

Allen-Bradley Guardmaster Safety Connection Systems are designed to:

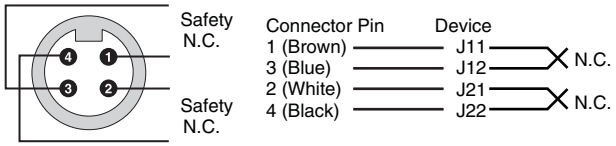
- Reduce installation cost
- Ease system expansion
- Simplify troubleshooting
- Promote system modularity
- Provide for Safety PLC input expansion
- Support systems up to Category 3 (per EN954-1)

Safety Connection Systems layouts are available with or without enunciation capabilities, allowing the user the option of direct feedback for the status of individual switches in the system. Enunciation systems utilize an auxiliary contact as input to tower lights, audible alarms, PLC input cards, etc.

Systems without Enunciation

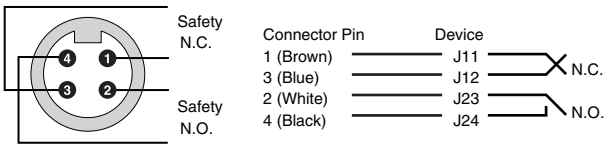
As illustrated in the example layout below, wiring systems for applications not requiring enunciation use a combination of patchcords, shorting plugs, safety wired distribution boxes and T-ports for series wiring of safety circuits. Distribution boxes for such an application are dual channel models with 2 N.C. or 1 N.C. + 1 N.O. contact configurations. See the wiring diagrams below for connector pin assignments.

Dual Channel 2 N.C.



Male Connector (On Switch)

Dual Channel 1 N.C./1 N.O.



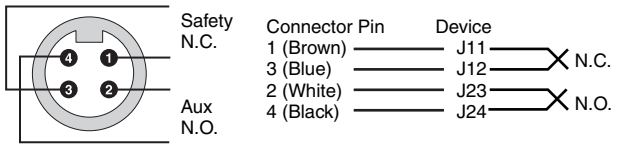
Male Connector (On Switch)

Note: Shorting plugs must be used on all unused ports for the system to operate.

Systems with Enunciation

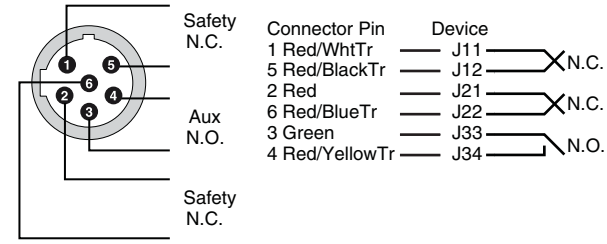
As shown below, system layouts with enunciation require patchcords, shorting plugs and distribution boxes, which allow for series wiring of the safety circuits while providing a separate circuit for enunciation. Distribution boxes are offered for these applications in two contact configurations: dual channel with 2 N.C. or single channel with 1 N.C. Each type also provides a N.O. auxiliary contact that is interfaced with the enunciation device to provide visual or audible alarm indication. In addition, LEDs on the distribution boxes assist in the troubleshooting of this system. See the wiring diagrams below for the associated connector pin configurations.

Single Channel 1 N.C./1 N.O.



Male Connector (On Switch)

Dual Channel 2 N.C./1 N.O.



Male Connector (On Switch)

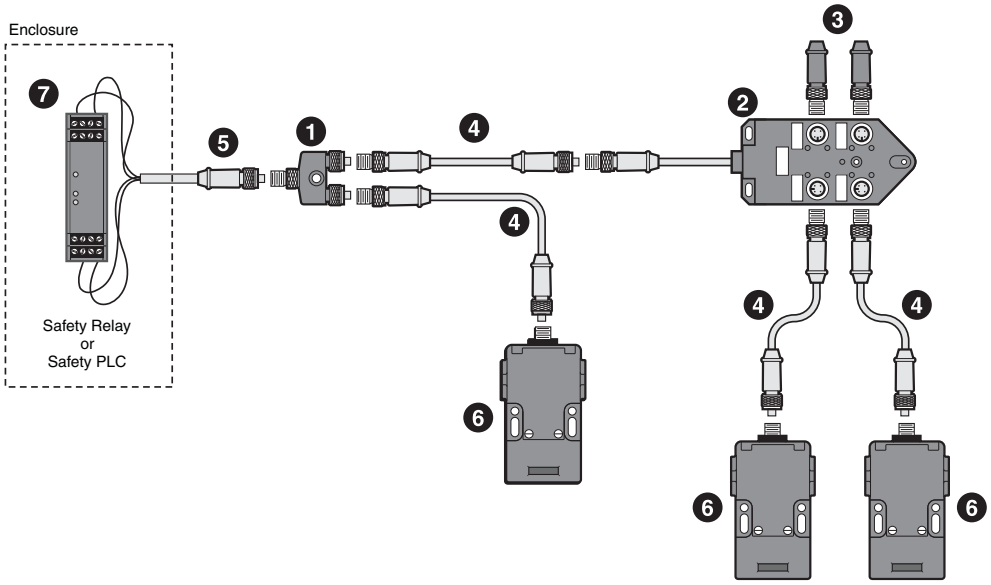
Note: Shorting plugs must be used on all unused ports for the system to operate.

Installation Considerations

Some important notes regarding Safety Connection Systems:

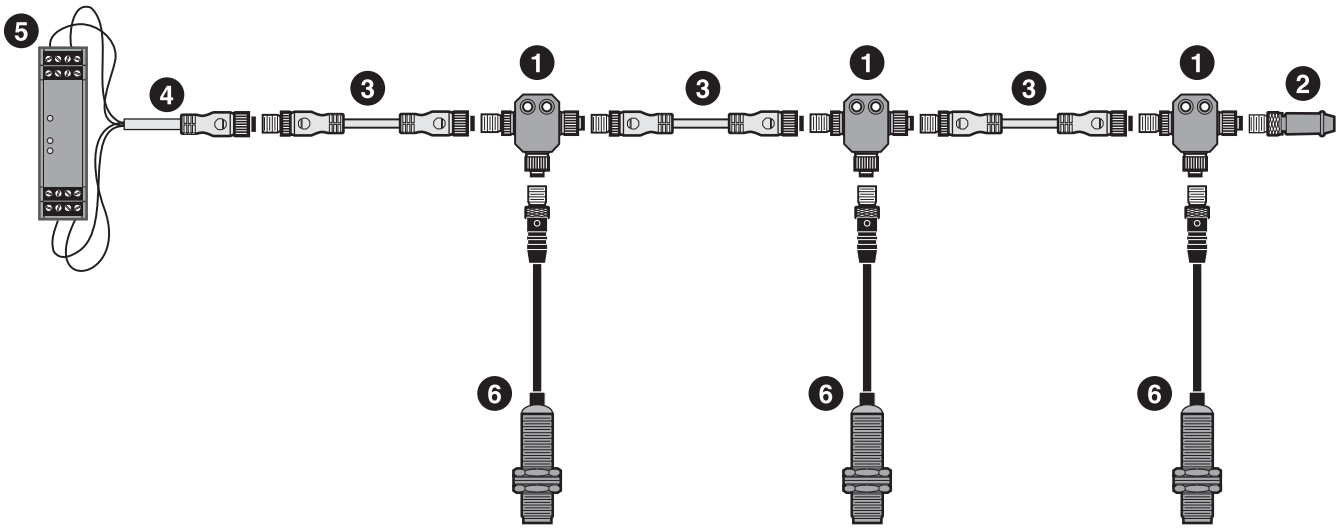
- To help ensure that only authorized personnel can access the connections, safety distribution boxes should be mounted in the 'guarded' area as defined in the risk assessment for the application.
- The safety connection system is designed to simplify the installation of safety devices—it does ***not*** control the safety circuit.
- Since the safety circuits are wired in series, shorting plugs must be installed in all unused distribution box ports in order for the system to operate.

Example Layout without Enunciation



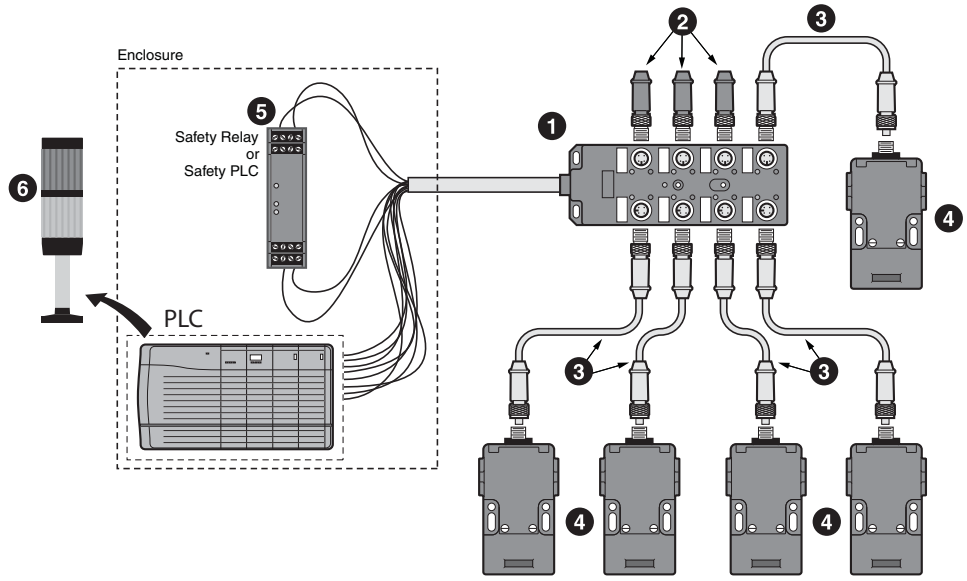
1. Safety-Wired Splitter/T-Port 7-6
2. Safety-Wired Distribution Box 7-7
3. Shorting Plug 7-11
4. Device Patchcord 7-12
5. Device Cordset 7-12
6. Safety Switch with QD 3-1
7. Safety Relay 5-2

SensaGuard Units Wired in Series without Enunciation



1. Safety-Wired Splitter/T-Port 7-6
2. Shorting Plug 7-11
3. Device Patchcord 7-12
4. Device Cordset 7-12
5. Safety Relay 5-2
6. SensaGuard with QD 3-56

Example Layout with Enunciation



1. Safety-Wired Distribution Box 7-7
2. Shorting Plug 7-11
3. Device Patchcord 7-12
4. Safety Switch with QD..... 3-1
5. Safety Relay..... 5-2
6. Tower Light ..... See *Industrial Controls* catalog

Safety Wired T-Port, DC Micro Style

Dual Channel, No Enunciation

Specifications

Connector Shell Material	Epoxy coated zinc
Contact Material	Brass, gold over nickel plating
O-Ring Material	Fluorelastomer
Enclosure Type Rating	IP67, NEMA 6P
Operating Temperature [C (F)]	-20…105° (-13…221°)

Features

- T-port/splitter designed for use with dual-channel safety devices with 4-pin DC micro connector
- PUR body offers good oil and chemical resistance
- Ratcheting coupling nut for vibration resistance
- For use in Category 2 or 3 systems per EN 954-1
- SensaGuard units may be wired in series maintaining a Cat. 4/SIL 3 rating

Product Selection

Connector Shell Material	Nickel-plated brass
Contact Material	Gold-plated palladium/nickel
Cable O.D.	9.8 mm (0.39 in.)
Cable Type	Oil-resistant yellow PVC jacket, (12) 18 AWG conductors
Enclosure Type Rating	IP67
Operating Temperature [C (F)]	-20…105° (-13…221°)

Features

- Prewired for single-channel (N.C.) safety with enunciation
- 8 safety wired 4-pin DC micro connectors
- Individual enunciation output for each port
- For use in category 2 or 3 systems per EN 954-1

Product Selection

Safety Wired Distribution Box, AC Micro Style

8-Port, Dual-Channel (2 N.C.) plus Individual N.O. Enunciation

Specifications

Housing Material	Red PBT
Connector Insert Material	PBT
Connector Shell Material	Nickle-plated brass
Contact Material	Gold-plated palladium/nickel
Cable O.D.	9.8 mm (0.39 in.) OD
Cable Type	Oil-resistant yellow PVC jacket, (6) 19 AWG conductors and (8) 22 AWG conductors
Enclosure Type Rating	IP67
Operating Temperature [C (F)]	-20…105° (-13…221°)

Features

- Prewired for dual-channel N.C. safety plus individual N.O. enunciation
- Eight 6-pin AC micro connectors
- 14-conductor main cable
- Individual enunciation output for each port
- For use in category 2 or 3 systems per EN 954-1

Specifications

Coupling Nut Material	Nickel-plated brass
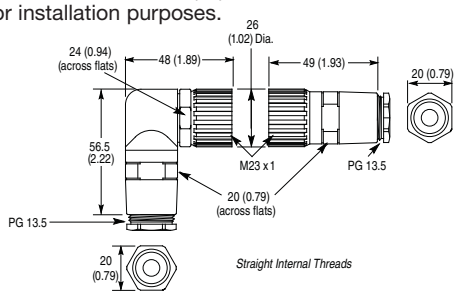
Connector Shell Material	Nickel-plated brass
Contact Material	Gold-plated palladium/nickel
Wire Rating	18 AWG (1.0 mm²), max.
Enclosure Type Rating	IP65
Operating Temperature [C (F)]	-20…+105° (-4…221°)

Features

- Straight or right angle, male or female
- 12-pin M23 style for standard connectivity
- Allows modification of existing cable installations and field creation of special cable lengths
- Solder connector for secure and reliable installation

Approximate Dimensions

Dimensions are shown in mm (in.). Dimensions are not intended to be used for installation purposes.



Product Selection

Connector Style	Cable Diameter [mm (in.)]	Face View			Cat. No.	
		Wire Rating	Female	Male	Female	Male

Right Angle Male					889M-R12AH-T	889M-E12AH-T

Receptacles, DC Micro Male

4-Pin, 5-Pin or 8-Pin and AC Micro Male, 6-Pin

Specifications

Connector Shell Material	Nickel-plated brass
Connector Insert Material	Nylon
Contact Type	Machined brass with gold over nickel plating
Wire Insulation	Oil resistant PVC, 22 AWG stranded copper, 300V
Operating Temperature [C (F)]	-20…+105° (-4…+221°)

Features

- Male bulkhead receptacles
- 4-, 5- or 8-pin DC micro configuration
- M16, M20 or 1/2 inch-14 NPT mounting threads

Approximate Dimensions

Dimensions are shown in mm (in.). Dimensions are not intended to be used for installation purposes.

Machine Safety Services

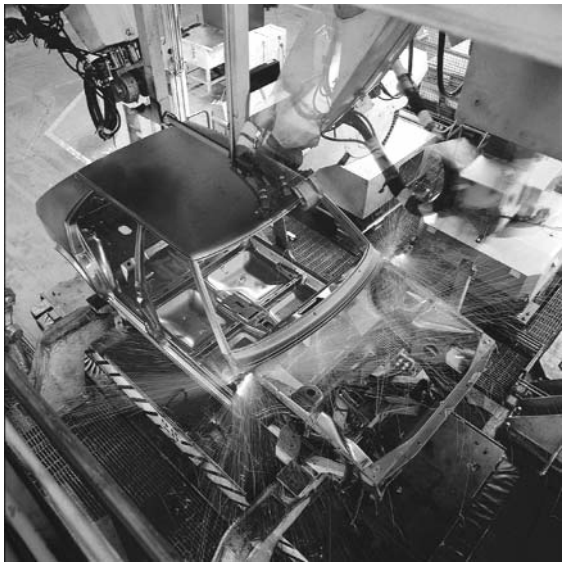
Overview



Risk assessments, risk reduction planning and project services allow companies to plan and implement safety programs for machine safeguarding applications to help reduce costs, improve compliance and enhance plant floor safety.

System Description

Rockwell Automation's Machine Safety Services include consulting, system integration and long-term support services for machines that must meet standards set forth by OSHA and ANSI in the United States. These services complement Rockwell Automation's expertise in metal forming and automation projects, including over 15 years of experience in automating mechanical and hydraulic stamping presses.

Rockwell Automation's Machine Safety Services include:

- Standards Training
  - Customer training on current standards and industry accepted interpretations
  - Standards updates as necessary
- Risk Assessment and Risk Reduction Planning
  - Coach/train client through procedures of risk assessment
  - Provide assistance with interpretation of standards and documentation of assessments
  - Facilitate an iterative process of mitigating each identified hazard by redesign or additional measures
- Technical Specification Development
  - Assist with the development of a machine safety standard that addresses safety solutions for an entire company, facility or machine
- Conformity Audits
  - Machine audits to verify and document compliance; a complete step-by-step assessment determines which standards are applicable and whether or not they have been satisfied
- Stop Time Measurements and Safety Distance Calculations
  - Help assess compliancy of light curtain and area guarding device installations
  - Help determine ergonomic and operational advantages of safeguarding options
- Safety Circuit Design
  - Including limited and sequential shutdown and applications
- Probability of Failure on Demand Calculations
  - Assist with obtaining a desired Safety Integrity Level (SIL) based on IEC 61508

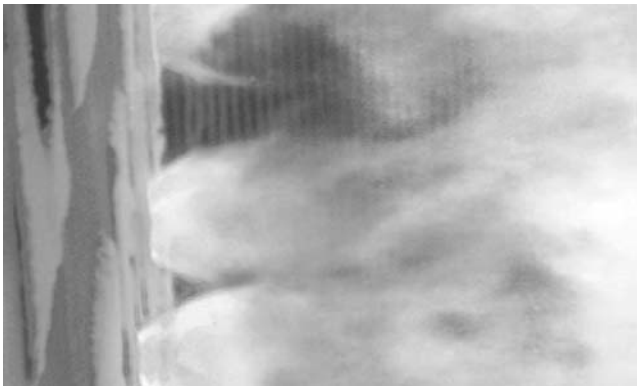
The implementation of a comprehensive machine safety program will involve many disciplines. Rockwell Automation has the entire spectrum covered. From the design and integration of safety critical circuits using the most advanced controls to the implementation of hard guarding. Rockwell Automation has the experience necessary to fulfill all your needs.

Typical machine system integration services can include:

- System Integration Services
- Project management
  - System architecture design
  - Panel design
  - Material procurement
  - RA products
  - Third party products (including hard guarding solutions)
  - Assembly
  - Software development
  - Hardware/software integration testing
  - Factory acceptance
  - Start-up assistance

Rockwell Automation's support and follow through are available at every stage and can include:

- On-Site Training
- Maintenance and operator training for our installed machine safety solutions
- Preventive Maintenance Programs
- Verify installed safety systems are operating within defined parameters
- Field Service
- Field work to be done on a contractual or as needed basis



System Description

Rockwell Automation burner management systems are engineered to provide igniter (pilot) and main flame detection, as well as control and monitoring of burner start-up and shutdown sequences including master fuel trip and purge.

The systems can help you:

- Protect against damage to your combustion process equipment and surrounding areas due to explosion or other undesirable event
- Qualify for lower insurance premiums resulting from compliance with applicable industry standards such as NFPA, IRI and FM
- Reduce installation times because our systems are fully assembled, programmed, thoroughly tested, and designed for immediate field installation
- Simplify unit operation through alarm management and operator displays
- Reduce start-up time with advanced diagnostics and operator help messages
- Reduce critical troubleshooting time through the use of pinpoint diagnostic messaging
- Enhance communication and reporting capabilities to other systems in your facility

Our BurnerMaster™ concept of burner management systems are designed for single burner applications for boilers, process heaters, furnaces, kilns and natural gas.

In addition to our family of burner management systems, Rockwell Automation offers related systems for control of combustion related processing including:

- Combustion temperature/pressure control
- Coal handling
- Ash handling and emission control systems
- Soot blowing
- Demineralizer control

Keep your combustion process safe and minimize fuel usage on the same platform!

Overview

Rockwell Automation offers various systems, bundled packages, and kits for meeting the safety-related control standards for the clutch/brake of mechanical stamping presses. These solutions are designed to meet the safety requirements of ANSI B11.1, OSHA 1910.217, CAN/CSA Z142-M90, IEC-61508, EN-954 and EN-692.

The 6556 Clutch/Brake kits are bundled packages consisting of redundant PLC components with application software, wiring diagrams, relays and documentation. Each solution is designed with independent redundant programmable controllers with additional electromechanical components and the application software to provide the necessary monitoring, self testing, security, and verification that make up a control-reliable design.

The PLC-5/x6 based kits come with the clutch/brake software secured in program file #16, and the user can add other logic to other files. The PLC-5-based kits are designed for large presses with extensive automation.

The MicroLogix™ kits are pre-programmed with the ladder program locked in flash memory. Certain features in the fixed kits are configurable. The MicroLogix-based Compact PressMaster™ kit, for example, has a variety of standard features to control ancillary functions such as lube and programmable limit switch that can be configured through pre-programmed PanelView screens. The fixed kits are easy to use, require no programming, and are designed for small to medium-size presses retrofitted by the user.

The StamPro™ system is a complete, ready-to-install, Logix-based press control system that comes with controllers and hardware for controlling a stamping press. Ancillary control functions, which can be purchased from Rockwell Automation or supplied by the user, are integrated into the system hardware and software designs. The StamPro system is designed for end users, OEMs and integrators. The system can be purchased either with pre-programmed optional functions or can be programmed by the user.

Some press functions which can be integrated with our solutions include:

- **Clutch/Brake.** The Allen-Bradley controller designed system that controls the dual-valve clutch/brake mechanism as found on all mechanical stamping presses. This system includes dual redundant controllers with application software for monitoring and self-testing to achieve safety regulation compliance.
- **Programmable Limit Switch (PLS).** Ladder Logic for switching outputs according to crankshaft position. The PLS is often used to integrate and synchronize other press auxiliary functions such as feeders, grippers, blow-off and ejector valves. This feature requires a resolver position input for accuracy. The PLS is usually pre-programmed and configured by the user for each job or die.
- **Die Monitoring.** Logic that monitors a variety of in-die sensors to determine misalignment, double blanks, misfeeds, part positioning, plus other critical conditions. The die monitor function requires a resolver input and is generally pre-programmed and configured for each job or tool.

Modes of Operation

The following table lists the modes of operation for each Rockwell Automation press control solution.

Press Modes of Operation	MicroLogix™ Clutch Brake	Clutch Pro™	Compact Press Master™	StamPro™ System
Off	X	X	X	X
Inch	X	X	X	X
Micro Inch			X	X
Single	X	X	X	X
Continuous	X	X	X	X
Remote & Auto Single				X

Contact your local Rockwell Automation sales office or Allen-Bradley distributor for pricing and order information.

Press Features/Functions

The table below summarizes the various press control functions available for each press control solution.

(S = Standard, O = Optional, P = User Programmable, Blank table cell = Function not available).

Description

A MicroLogix™ 1500 processor-based Clutch/Brake Package is a bundle of hardware, software, and documentation that controls the basic clutch/brake mechanisms on mechanical stamping presses. This package requires no user programming. It can be interfaced with other controllers such as the ControlLogix system.

The package uses redundant MicroLogix 1500 processors with application software for self testing and verification to help meet the safety requirements of ANSI B11.1, OSHA 1910.217 and CAN/CSA Z142-M90 press safety regulations for mechanical stamping presses. Each MicroLogix 1500 processor has the basic clutch/brake functionality as well as the basic diagnostics to interface to several display options making it an easy-to-use cost-effective solution for small presses. Since you don't need programmable controller experience; you can just wire and mount the equipment.

For other press functions such as programmable limit switch, automation control, die protection monitoring and resolver based, consider using the Compact PressMaster system. If you require more automation flexibility or need a custom system, consider using the StamPro system.

Control Features

- Four sets of Run buttons monitored
- One set of Inch buttons monitored
- AC and DC versions
- Hard wired cross-checking
- Open communication for diagnostics

Modes of operation:
  – Off
  – Inch
  – Single
  – Continuous (Armed)
- Brake monitoring
- Top stop overrun and anti-repeat protection

System Requirements

- Rotary Cam Limit Switch or Allen-Bradley Encoder
- Motion detection device
- Self-checking valve

Ordering Information

The purchase of one kit includes the license to use this control on one stamping press.

- Contact your local Rockwell Automation Sales office or Allen-Bradley distributor.
- Email inquiries to: metalforming@ra.Rockwell.com
- FAX inquiries to: 440-646-4843
  Attention: Metalforming Group

The **HMI** option, which must be ordered in addition to the basic Clutch/Brake package, includes installed software, communication modules, and necessary cables.

New—Enhanced Options for MicroLogix Clutch/Brake Controllers

Option Description	Option Number
HMI Option — Includes PanelView™ Plus 400, network hardware for Ethernet/IP and software for diagnostics, brake monitor setup, and encoder configuration.	PV400
Encoder, scanner module, and software to create a dual encoder feedback system for press position.	PF1
One operator run station on T-stand with run, top stop, and E-stop pushbuttons	RS1

Press Control Systems

PressMaster™

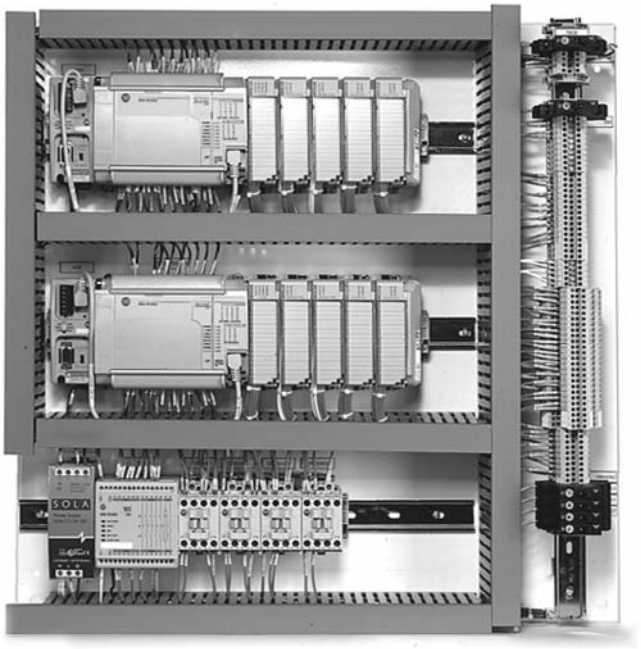
Help reduce operating costs and downtime with flexible press controls.

The Rockwell Automation Compact PressMaster™ System is a cost competitive, programmable controller-based system used for the control and monitoring of mechanical stamping presses. Help reduce cost and risk by purchasing a complete system, pre-wired and tested, ready for installation. The system is designed to modernize your press controls, increase control system reliability, and help reduce downtime by providing comprehensive operator diagnostics. Compact PressMaster provides press users, rebuilders, and OEMs a low cost PLC based control system to remain competitive and reduce risk.

System Description

The Compact PressMaster System is an expandible press control system based on standard Rockwell Automation components available locally and supported worldwide. Compact PressMaster Systems provide press control, operator interface with comprehensive diagnostics, expandability, and motor controls in a single integrated package. The system is provided, ready to install, with a complete set of documentation.

The Compact PressMaster System is based on the standard Bulletin 6556 clutch/brake control with dual processors and software designed by Rockwell Automation to help customers comply with ANSI B11.1, OSHA 1910.217, CSAZ142-2002, and EN 954. An Allen-Bradley PanelView operator interface is included to complete the system and provide maximum reliability.



Standard Features

Standard features include:

- Safety interlocks and light curtain interface
- Clutch/brake safety control with inch, single stroke, continuous, modes of operation
- Main motor control
- Lubrication control
- Slide adjust control
- Operator fault and prompt messages, alarm status operator screen
- One industrial absolute encoder
- Brake time monitoring and 90° stop test
- Interface for four run stations with anti-tiedown protection
- Press stroking anti-repeat and top stop overrun protection
- Clutch/brake and counterbalance air pressure monitoring
- User immediate and top stop control interlocks
- Production counters
- Variable speed compensation

Optional features available:

- Automatic slide adjust
- Sixteen channels of die protection
- Eight programmable limit switch outputs
- Hydraulic overload control
- Light curtains with muting
- OEM packages
- Automatic counterbalance control
- 6-inch color operator display terminal

Results

A Compact PressMaster System helps provide:

- Reduced downtime through advanced diagnostic messages, helpful operator prompts, and on-line control system troubleshooting.
- Improved system reliability through the use of standard Rockwell Automation industrial control hardware and software.
- Increased operational flexibility and expandability, while reducing costs and risk.
- Compliance with ANSI, OSHA, and CSA regulations.
- A press control that can grow with your stamping operations.

Ordering Information

- Contact your local Rockwell Automation sales office or Allen-Bradley distributor.
- Email inquiries to: metalforming@ra.Rockwell.com
- FAX inquiries to: 440-646-4843
  Attention: Metalforming Group

Help reduce operating costs and downtime with flexible programmable press controls.

The Rockwell Automation StamPro™ System is an advanced programmable controller-based system used for the control and monitoring of mechanical and hydraulic stamping presses. The StamPro control system is for customers who want to help reduce cost and risk by purchasing a complete pre-engineered system, ready for installation.

System Description

The StamPro System is a flexible, pre-engineered press control system based on standard Rockwell Automation components available locally and supported worldwide. StamPro Systems provide press control, operator interface, and magnetics in an integrated package with a complete set of documentation. The use of field-proven hardware and software helps users minimize cost and risk, while also helping to comply with the necessary ANSI, OSHA and CSA standards.

System Architecture

The StamPro System uses the Allen-Bradley Logix family of processors. The safety kernel, executed in dual Logix processors, is based on the standard Bulletin 6556 clutch/brake control with dual processors and software designed by Rockwell Automation to help customers comply with ANSI B11.1/B11.2, OSHA 1910.217, CSAZ142-2002, and EN 954.

This safety kernel is coupled with optional application software that provides all other press automation control, monitoring, information and network requirements. The Logix programming environment allows the user to add their own additional custom software into the same processors where the safety kernel resides, to help minimize control hardware costs. The standard operator interface is a pre-programmed color PanelView™ Plus 1000. The system is available in a freestanding console or an upright enclosure with a press mounted operator station.

Features

The StamPro System is modular, which allows each system to be configured to the requirements of each specific application and easily accommodates control expansion for future needs.

Standard features include:

- Stop time monitoring for hands in die
- Safety Interlocks and Light Curtain interface
- Main Motor/Pump control
- Lubrication control
- Manual Slide Adjust/ Ram Profile Control
- A 10-in. color operator interface terminal with Alarm Status/History and Fault/Prompt
- Clutch/Brake Safety Control
- Interface for four run stations with anti-tiedown protection

Optional features include:

- Fully assembled and mounted in a NEMA 12 rated industrial enclosure with one set of operator run palm-buttons
- Automatic Slide Adjust Control
- Die Protection Monitoring
- Programmable Limit Switch
- Tonnage Monitoring
- Die Clamp Control
- Die Cushion Control
- Bolster Control
- Light Curtain with muting
- Hydraulic Overload Control
- Recipe Management
- Automatic Die Change
- Automatic Counterbalance Air Pressure Control

Results

A StamPro System will help provide:

- Reduced downtime through comprehensive operator diagnostic messages, on-line control system troubleshooting and replaceable modular components available worldwide.
- Increased flexibility through open integration of press control functions and industry-standard connectivity to other equipment including coil feeds, computers, drives, robots and servo transfer feeds.
- Improved quality through recipe-based control of process parameters such as shut height, counterbalance air pressure, motor speed, die protection and programmable limit switch.
- Reduced costs through the use of standard Rockwell Automation industrial control hardware, field-proven application software, and a comprehensive documentation package.

Ordering Information

- Contact your local Rockwell Automation Sales office or Allen-Bradley distributor.
- Email inquiries to: metalforming@ra.rockwell.com
- FAX inquiries to: 440-646-4843

Explosion Proof

Ex Range 9-2

Intrinsically Safe Galvanic Isolators

Overview 9-4
Isolators 9-5
Accessories 9-7

Pneumatic

Lifeline™ 4 and Rotacam™ 9-10

Ex Range

Description

The Guardmaster Ex Range of safety switches are specifically designed for potentially explosive atmospheres. They retain the safety features and operating principles of the conventional Guardmaster switches. They incorporate a sealed flameproof contact block, making them suitable for use in European Zone 1 and Zone 2 environments. In the US and Canada, these products can be used in areas classified as Class 1, Division 2 in Groups A (acetylene), B (hydrogen), C (ethylene) and D (propane). All the Guardmaster Ex switches conform to the exacting standards required by the European harmonized standards. The contact block in these switches has the following approvals: 112G EExd IIC T6 or T5 and 11 2D T80°C IP66.

EEx equipment conforms to types of protection standardised by CENELEC (European standards), EN50014 and EN50018 respectively and BS5501 parts 1-V.

The d suffix indicates that the contact block in the switch is a flameproof enclosure and is designed to ensure that if an internal explosion occurs it will be contained with the enclosure. The designation II indicates use in surface industries and c refers to the group of gases for which the switches are suitable. The designation T represents the surface temperature classification of the switch. These switches have been tested with an ambient temperature of 60°C as opposed to the normal test limit of only 40°C, allowing them to be used in gases having a low flash point.

It should be noted that these groups refer to the explosion-proof qualities of the switches and not corrosion-resistance characteristics. Special precautions may be required to protect the vulnerable parts such as PVC-covered cables against attack by certain corrosive elements and physical damage.

Features

- For use in potentially explosive atmospheres
- Positive mode action, flameproof contact block
- Suitable for use in European Zone 1 and 2 environments
- US and Canada: Class 1, Division 2 in Groups A, B, C and D

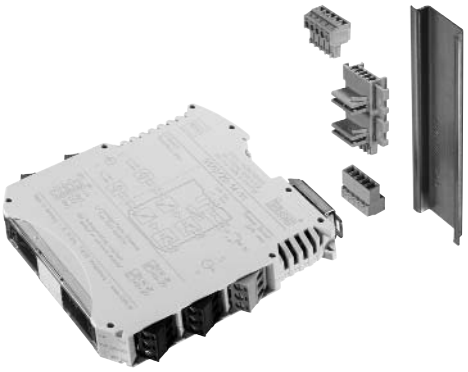
Intrinsically Safe Galvanic Isolators

Overview

Intrinsically Safe Galvanic Isolators



Accessories

Description

For applications involving sensor use in hazardous locations, Rockwell Automation offers a line of Intrinsic Galvanic Isolators, which offer economical solutions for instrumentation and control systems in hazardous locations as defined by NEC article 500 and CEC Part I, Section 18.

Intrinsically Safe or Galvanic Isolators are active protective interface assemblies that limit the amount of energy allowed to enter a hazardous area under fault conditions. Sometimes called Transformer Isolated Barriers, they separate intrinsically safe wiring from non–intrinsically safe wiring through the use of the same isolation coils found in power transformers as defined in FM Class No. 3610 and CSA 22.2 No. 157.

Galvanic isolators, unlike zener diode barriers, do not require grounding—therefore they may reduce ground loop problems as well as installation and maintenance costs. The solid state output version isolators can be located in a Division 2 area. The slim ¾ inch wide housing on DC models also conserves valuable mounting space, while providing 1500 Volt isolation between hazardous area and nonhazardous area terminals and 500 Volt isolation between input/output and external power terminals. DIP switches provide convenient programming of output and diagnostic functions while multiple LEDs provide visual indication of module and circuit status.

Rockwell Automation's zener diode barriers and galvanic isolators are DIN-rail mountable and designed primarily for use with intrinsically safe proximity sensors and photoelectrics. All of Rockwell Automation's barriers and isolators are FM and CENELEC approved, CSA certified and CE marked for all applicable directives.

Intrinsically Safe Galvanic Isolators

Features

- DIN rail mounting with power bus option
- Removable field connection terminals
- Single- and two-input versions
- Variety of output types
- Approvals to worldwide standards
- SIL 2 and 3 rated
- Intrinsically safe connections for Class I, II, III, Div 1; Groups A-G (EExIa), IIC/IIB

Specifications

Certifications	FM,CSA, UL, CENELEC (PTB) approved and CE marked for all applicable directives
Number of Inputs	2
Switching Current @ Voltage, Max.	8V @ 8.2 mA (to EN 60947-5-6 NAMUR)
Input Current	On > 2.1 mA; Off < 1.2 mA
Input Resistance	1000 Ω
Switching Frequency (Hz)	< 15 Hz
Switch Delay	On to Off: 15 ms; Off to On: 15 ms
Status Indicators	Green = Power; Yellow = Output Closed; Red = Wire Break/Short
Operating Temperature [C (F)]	-20…+65° (-4…+149°)
Relative Humidity	<95% RH
Housing Material	Polyamide 6GF
Enclosure Type Rating	IP 30
Mounting	35 mm DIN rail
Conductor Size, Max.	0.2…2.5 mm² (24-14 AWG)
Weight [g (lbs)]	160 (0.35)

Approximate Dimensions [mm (in.)]

Dimensions are not intended to be used for installation purposes.

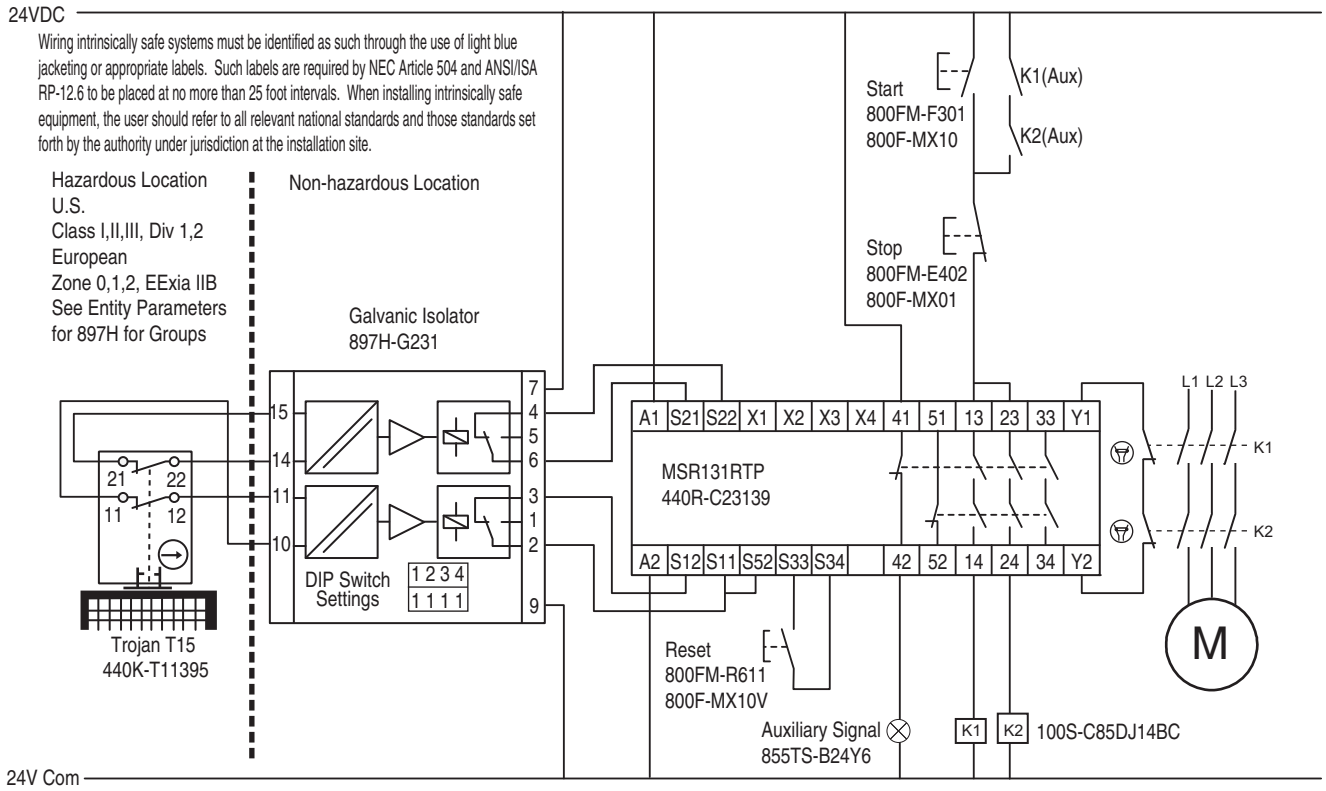
Intrinsically Safe Galvanic Isolators

Safeguarding Applications



Circuit Status

Circuit shown with the safety gate closed. The motor is ready for starting.

Operating Principle

The galvanic isolator limits energy to the interlock switch, which is considered a simple apparatus in the hazardous location. The MSR131RTP safety relay checks the outputs of the galvanic isolator upon power-up and each time the gate/e-stop is actuated. The Minotaur safety relay also monitors the status of the safety contactors (or safety control relays).

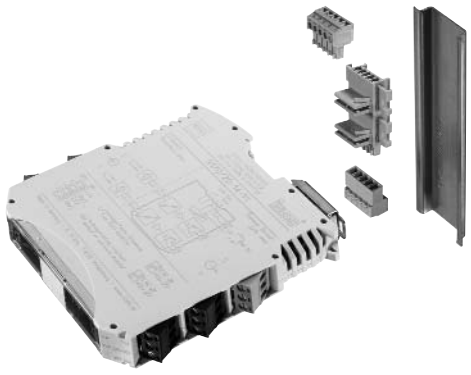
STARTING: Press and release the Reset button to energize the safety outputs (13/14 and 23/24) of the MSR131RTP. Press the Start button to start the motor.
STOPPING: Opening the safety gate or pressing the stop button will stop the motor. If the gate is opened, the gate must be reclosed and the reset button then pressed to energize the outputs of the MSR131RTP.

Fault Detection

The DIP switch setting of the galvanic isolator allows for open and short circuit detection of the tongue interlock switch, as well as opening the gate. The tongue interlock switch should be wired to both inputs (terminals 7 and 8) of the galvanic isolator to drive both outputs (1/5 and 2/3) of the galvanic isolator. A single fault will not cause a loss of safety function. If one output of the galvanic isolator fails in the closed state, the Minotaur safety relay will detect opening of the 2nd output and turn the motor off. The motor will remain off until the fault is corrected or power is cycled. If either contactor K1 or K2 sticks ON - the motor will stop on command due to the other contactor, but the Minotaur safety relay cannot be reset (thus the fault is revealed to the operator). The manual Reset button will prevent the motor from starting in the event of a shorted Start switch.
A single fault detected on the Minotaur safety input circuits will result in the lock-out of the system to a safe state (OFF) at the next operation of the safety gate or e-stop device.

Ratings

This circuit meets the safety performance requirements of Category 3 of EN954-1:1996. This circuit executes a Category 0 stop.



Description

Rockwell Automation Galvanic Isolators can be daisy chained together via power bus connectors. The snap-on connectors save time and simplify wiring for power distribution and error identification on a series of modules. Each end on a string of bussed isolators is terminated with a screw terminal connector. The line fault and power supply failure line are bridged on these connectors to close the current.

Intrinsically Safe Wiring Labels/DIN Mounting Rail

Intrinsically Safe Wiring Labels

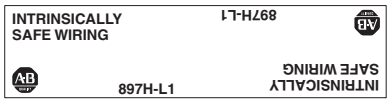

Figure 1

Figure 2

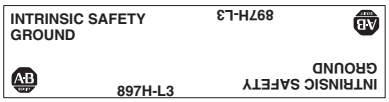

Figure 3

Description

It is recommended that wiring for intrinsically safe systems be identified as such through the use of light blue jacketing and/or through appropriate labels. Such labels are required by NEC Article 504 and ANSI/ISA RP–12.6 to be placed at no more than 25 foot intervals. When installing intrinsically safe equipment the user should refer to all relevant national standards and/or those standards set forth by the "authority having jurisdiction" at the installation site.

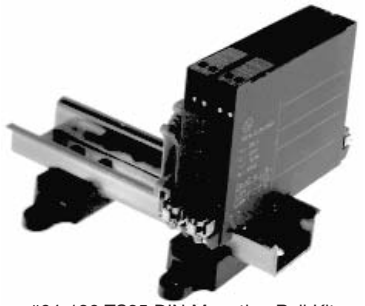
DIN Mounting Rail



#64-136 TS35 DIN Mounting Rail Kit
(Barriers not included)

#64-134 TS35 DIN Mounting Rail

Description

DIN rail provides convenient and simple mounting of barriers, isolators, and other control equipment. DIN rail is available from Rockwell Automation/Allen-Bradley in one meter sections (Cat. No. **64-134**) or as part of a mounting kit (Cat. No. **64-136**). By isolating the DIN rail from the mounting surface, the mounting kit allows 897H- series shunt diode barriers to be grounded directly to the rail.

Product Selection

Description	Cat. No.
1 m (3.3 in) prepunched zinc-jplated and chromated steel mounting rail per EN 50022/DIN 46277 (TS35)	64-134
DIN Rail Mounting Kit includes 12 inch DIN rail, two insulated standoffs, and two grounding terminals	64-136

Pinout and Color Code

	Face View Pinout	
	4-Pin	
			Female	Male
Color Code	1 Brown 2 White 3 Blue 4 Black 5 NA	

Description

As defined in the National Electric Code (NEC), intrinsically safe wiring must be identified by color coding with light blue jacketed cable or by labeling at regular 25 foot or less intervals. When installing intrinsically safe equipment, the user should refer to all relevant national standards and/or those standards set forth by the "authority having jurisdiction" at the installation site. Rockwell Automation cordsets and patchcords with blue PVC jacketing provide a cost effective solution for easy identification of intrinsically safe wiring. Unlike tags, that may fall off or become unreadable, this rugged cable maintains its visibility, even in harsh environments. No labor time is required for labeling the cable while it is being installed or during maintenance.

Lifeline 4 and Rotacam

Description

Pneumatic Rotacam

Based on the highly successful conventional Rotacam, the Pneumatic Rotacam has the same design features except that it gives positive acting isolation of a machine's compressed air supply instead of an electrical power source.

The switch is mounted at the hinge point of the guard door. The bored stainless steel operating shaft is mounted in a sealed bearing which is so robust that it enables the switch itself to be used as the hinge pin if necessary.

The pneumatic valve specifications are shown below. The external switch dimensions and operating shaft specifications are the same as the conventional Rotacam.

Note: The Pneumatic Rotacam does not have the adjustable cam used with the standard Rotacam.

Pneumatic Lifeline 4

Based on the conventional Lifeline 4 this rope operated pneumatic safety switch can be used for guarding exposed pneumatic machinery and conveyor equipment.

The Pneumatic Lifeline 4 is immune to machine vibration thus overcoming the problem of nuisance tripping.

The pneumatic valve specifications are shown below. The external switch dimensions are the same as the conventional Lifeline 4.

Features

Pneumatic Rotacam

- Can be used as a hinge pin with light and medium weight guard doors on pneumatic machinery
- Isolates pneumatic power within 5° of guard movement

Pneumatic Lifeline 4

- Switches pneumatic power with up to 75 meter span
- Lid mounted emergency stop button, designed to EN418
- Switch lockout with indication of rope pulled and rope slack

Specifications

Standards Pnuematic Rotacam	IEC 60947-5-1, ISO 14119, ISOTR 12100
Standards Pneumatic Lifeline 4	IEC 60204-1, IEC 60947-5-1, ISO 14119, ISOTR 12100, IEC 60204-1, ISO 13850
Pneumatic Fluid	Compressed air or neutral gas
Pressure Range	2…8 bars
Passage Diameter	2.7 mm
Connection Type	Push in fittings for standard 4 mm Ø nylon tube, internal Ø 2.5 mm
Flow Rate	138 NL/min. (ie., number of liters of air at normal atmospheric pressure obtained with the output open to atmosphere and the supply pressure at 4 bars).
Mechanical Life	1,000,000 operations
Operating Temperature [C (F)]	10…60° (50…140°)

Note: For other specifications and dimensions see relevant specifications of standard product.

* These ratings are general guidelines that would likely apply in most instances. Safety performance ratings are applied to safety functions. The safety rating must be applied from an input device through a logic device to an output device. Many of the application examples contain multiple devices and may have mulitple safety functions. Therefore, a detailed analysis of the application and complete implementation of the standard is required and may result in ratings that differ from the guidelines provided.

Notes for Use with Application Circuit Examples

Note 1

In the following circuits the type of Allen-Bradley/Guardmaster device is shown as an example to illustrate the circuit principle. For specific applications the choice of device type should be based on the suitability of its characteristics for its intended use.

Note 2

In most of the following examples showing dual channel applications, one interlock switch is shown switching both channels (one contact set per channel). If it is foreseeable that damage to the guard (e.g., at the actuator mounting point) could allow it to be opened without operating the switch then two separate switches may be required. The electrical principle of the circuit will remain the same.

Note 3

In most cases the circuits are shown with the guard door closed and ready for motor starting by operating the normal start control.

It must be possible to start the machine only by voluntary actuation of the control provided for the purpose (see ISO 12100-2 4.11.8). For the purposes of these examples the use of a conventional contactor latching circuit has been assumed. If this is not the case, then a restart interlock will be required to prevent an automatic or unintended starting of the motor when the guard is closed. For example, a Minotaur safety relay with a momentary action push button installed in the output monitoring circuit can be used to achieve this.

If the guard is designated as a Control Guard (see ISO 12100-2 5.3.2.5) these requirements do not apply but the use of control guards is only allowed under certain conditions including:

- A control guard can only be used where there is no possibility of an operator or part of his body staying in or reaching into the danger zone whilst the guard is closed.
- The control guard must be the only access to the hazard area.
- The interlocking system must have the highest possible reliability. It is often advisable to use a solenoid locking switch such as the Guardmaster Atlas or TLS-GD2.

Note 4

Safety monitoring relay units used in dual channel circuits with infrequent operation or with more than one switching device connected. This note applies to all monitoring devices which use the technique of comparing the signal at the change of state of dual channels.

Certain faults are only detected at a change of state of the input switching device (interlock switch or E-Stop switch). If there are long periods (e.g. months as opposed to days) between switching actions, it may be possible for multiple faults to accumulate which could lead to a dangerous situation. Therefore a regular check should be performed on the system in order to detect single faults before an accumulation occurs. This check may be manual or initiated by part of the machines control system.

If, for example, 3 interlock switches are connected to the monitoring unit, certain faults will only be detected at the switch on the first guard to be opened and the switch on the last guard to be closed. This is because any switching between the first opening/last closing will not change the state of the monitoring unit input circuits. Therefore in some applications it may be necessary to use one monitoring device per switch.

Most of the following examples show an interlock switch and an emergency stop switch combined in the circuit. When a monitoring safety relay (e.g. Guardmaster Minotaur) is used for fault detection it is important to note the following:

- All safety critical single faults, except for certain faults over the contact sets at the E-Stop, will be detected at the next opening of the guard.
- All safety critical single faults, except for certain faults over the contact sets at the interlock switch, will be detected at the next operation of the E-Stop.
- Because the E-Stop device is not likely to be operated frequently, it is recommended that its function is checked (with the guard closed) on a regular basis (start of shift or daily) to enable the Minotaur to detect single faults. If the guard is rarely opened, the interlock switch should be checked in a similar manner.

Note 5

This symbol indicates that the associated component or device features direct opening (positive opening) operation. In the event of a fault, welded contacts will be forced open by the motion of the safety guard.

This symbol denotes mechanically linked contacts; if one contact welds closed, all other dependent (auxiliary) contacts remain in position, i.e. they cannot change state.

General Safety Information

IMPORTANT This application example is for advanced users and assumes that you are trained and experienced in safety system requirements. Contact Rockwell Automation to find out more about our safety risk assessment services.

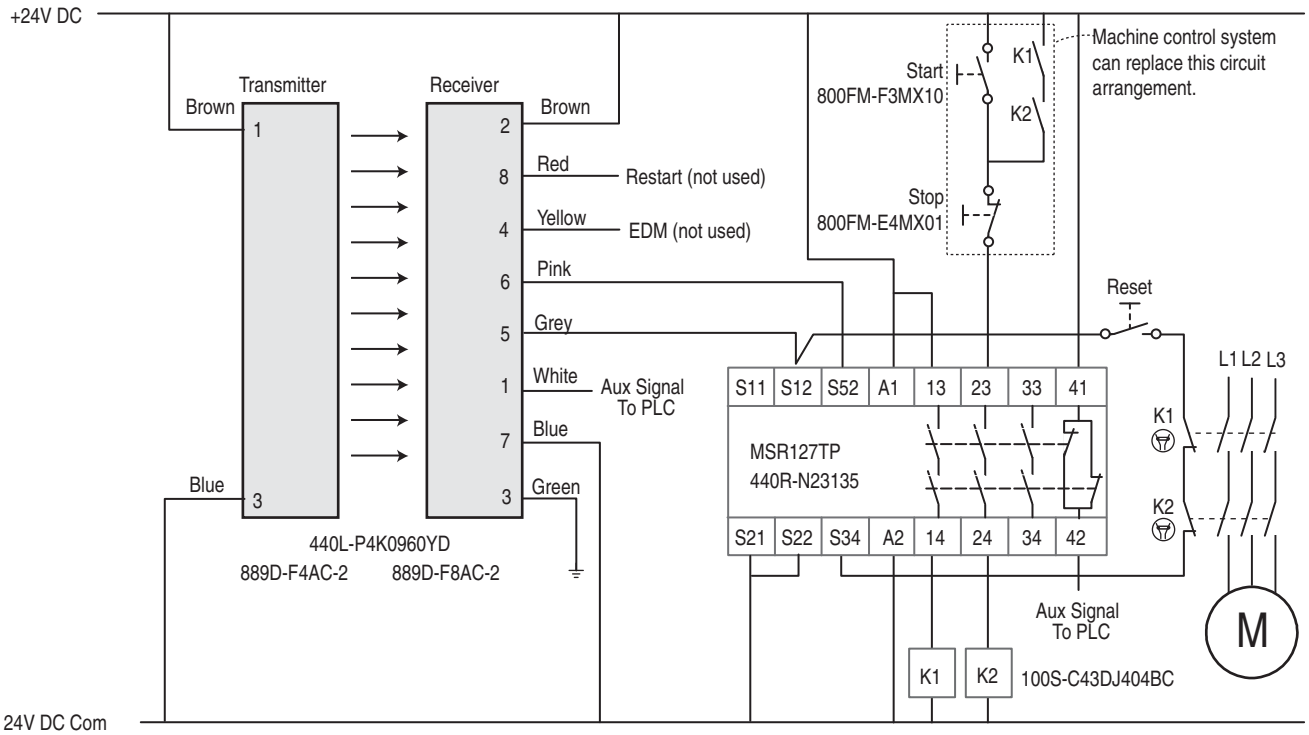
ATTENTION

A risk assessment should be performed to make sure all tasks and hazard combinations have been identified and addressed. The risk assessment may require additional circuitry to reduce the risk to a tolerable level. Safety circuits must take into consideration safety distance calculations which are not part of the scope of this document.

For other Important User Information and Safety Guidelines, please review pages G-2 and G-3 in the General section of this catalog.

Light Curtain—Point of Operation Control

GuardShield, 800F, MSR127, 100S



Circuit Status

The light curtain is configured with the factory default settings (Guard only mode) and is unobstructed. The outputs of the safety relay are open. The motor is off and ready to run.

Operating Principle

STARTING: Press the Reset button to close the outputs of the MSR127. Press the Start button to energize contactors K1 and K2. The motor starts with the two normally open contacts of K1 and K2 holding the circuit energized.
STOPPING: Obstructing the light curtain de-energizes the safety outputs of the MSR127, which in turn drops out K1 and K2. The contactors disconnect the motor from its power source, and the motor coasts to a stop. Clearing the obstruction in the light curtain does not cause the motor to energize (the Reset and Start buttons must be pressed). The motor can also be turned off by pressing the stop button.

Fault Detection

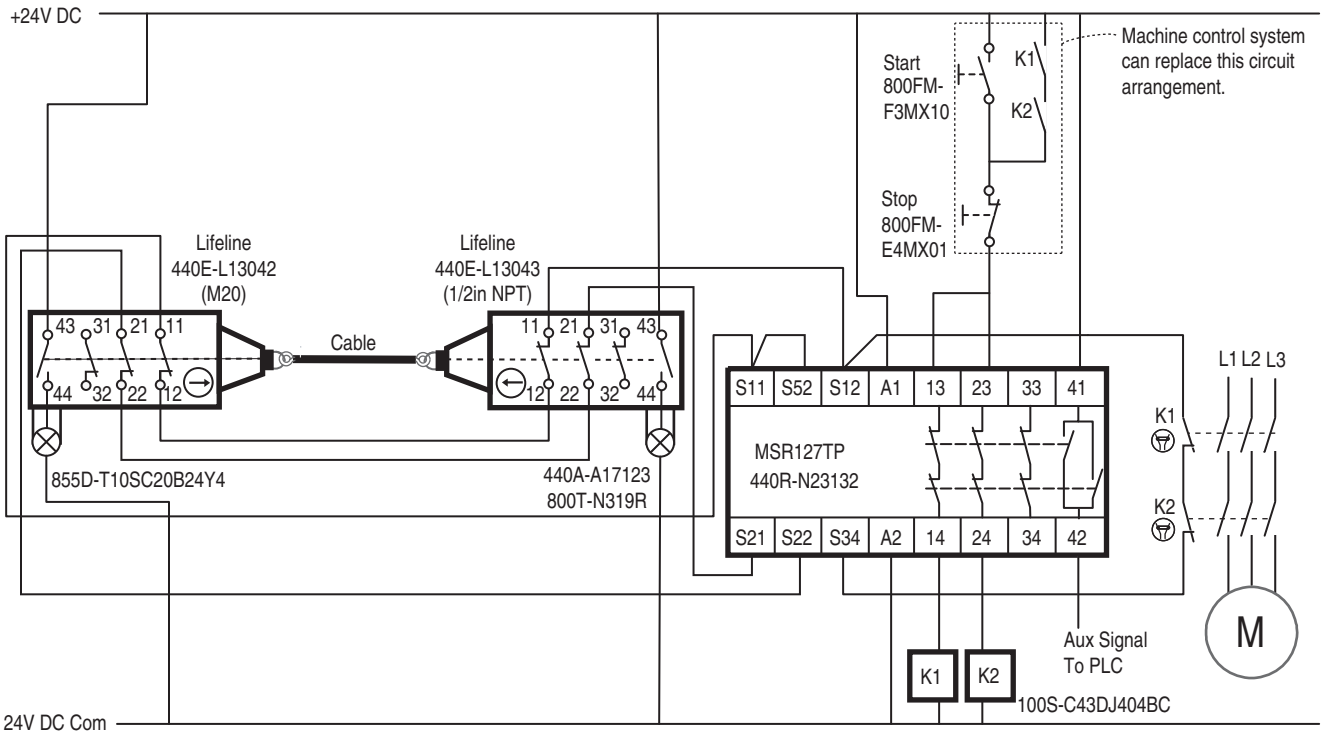
Upon successful completion of internal checks on power up, the GuardShield light curtain energizes its outputs with no objects present. The GuardShield light curtain outputs turn on. If a crossfault is detected, the GuardShield light curtain goes to a lockout state with its outputs off. After successful completion of internal checks, the MSR127 checks the signals from the light curtain. If OK, the MSR127 then checks the status of the K1 and K2 contactors. If either K1 or K2 fails in the actuated state, the other contactor will disconnect the motor. The MSR127 will detect the faulted contactor and will not allow the motor to restart until the fault is corrected.
Contactors K1 and K2 are controlled by the safety system. Contactor K2 is controlled by both the machine control system and the safety system. This increases the probability of performance of the safety function because K1 is significantly less likely to weld at the same time as K2 due to the diversity of expected wear out times.

Ratings

The safety function intiated by the GuardShield light curtain meets the safety performance requirements of SIL CL 3 per IEC 62061:2005 and has a Category 4 structure that can be used in systems requiring Performance Levels up to PLe per ISO 13849-1:2006. This circuit executes a Category 0 stop.

Cable Pull

Lifeline, 800F, MSR127, 100S



Circuit Status

Both Lifeline cable pull switches are taut and reset; their contacts are closed. The MSR127 safety relay is energized, as its inputs and monitoring circuits are satisfied. The motor is off and ready to run.

Operating Principle

Two cable pull switches are used to protect an area over 10 meters in length. Auxiliary lights provide indication as to which switch has been actuated to stop the motor. The difference between the two switches is the conduit thread and is shown for example purposes.

STARTING: Press the Start button to energize contactors K1 and K2. The motor starts and the two normally open contacts of K1 and K2 close to hold the circuit energized across the Start button.

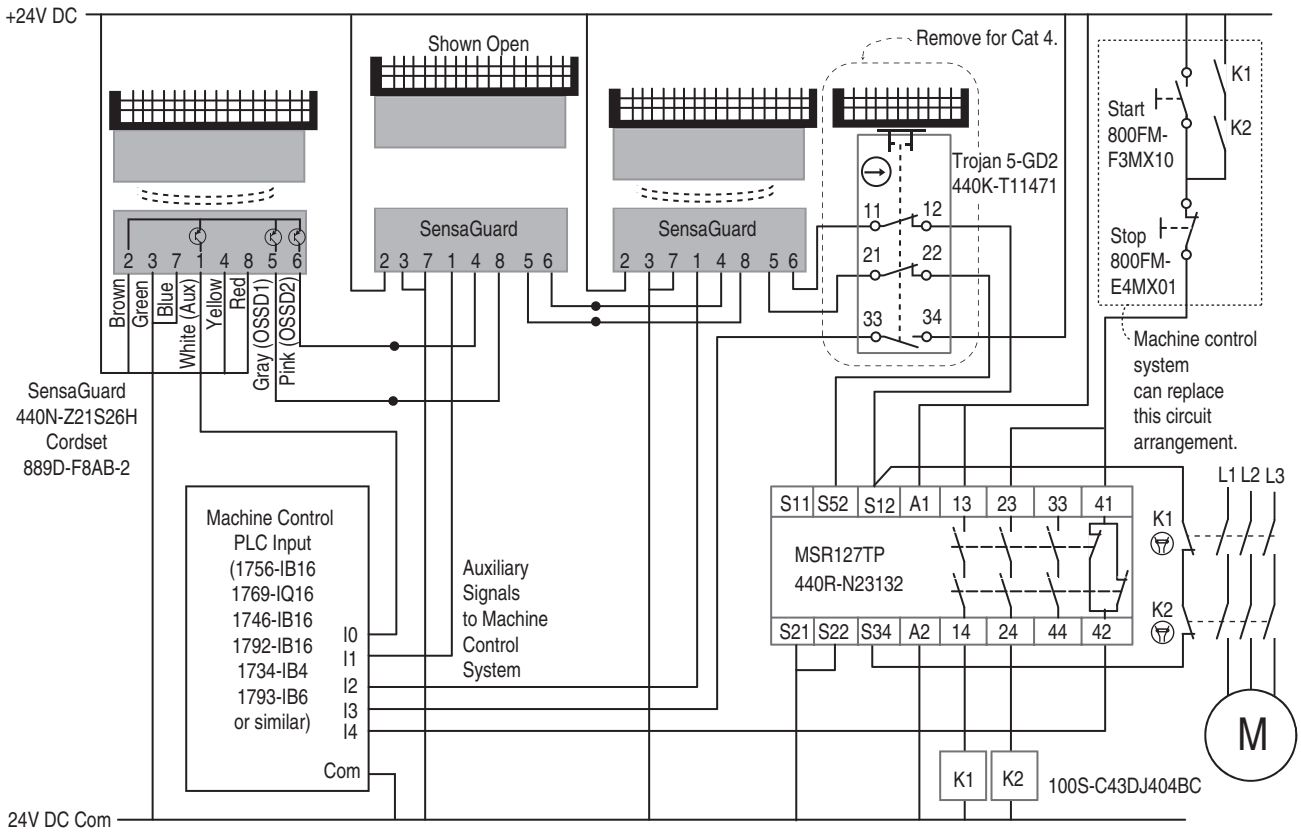
STOPPING: Pull the Lifeline cable or press the e-stop button on the Lifeline switch to de-energize the outputs of the MSR127 and turn off the motor. To restart the motor, make sure the area is clear of hazards, pull out the e-stop button (if pressed) and rotate the reset knob on the Lifeline 4 to the Run position. Then press the Start button to start the motor. As an alternative, the motor can be stopped by pressing the Stop pushbutton. It can then be restarted by pressing the Start pushbutton.

Fault Detection

Upon successful completion of internal checks on power up, the MSR127 checks its input circuits. With both Lifeline switches reset, the MSR127 checks the output contactors through the S12/S34 circuit. If the contactors are off, the MSR127 energizes its outputs and turns on the contactors which turn on the motor. A short or open circuit fault in the Lifeline cable pull switches will be detected by the MSR127. If either the K1 or K2 faults in the energized state, the motor will be stopped by the other contactor and the fault will be detected by the MSR127 on the next attempt to restart. An internal fault in the MSR127 will be detected by itself. Depending on the type of fault, the result will be de-energization of the K1 and K2 contactors or prevention of re-start.

Ratings

The safety function initiated by the Lifeline cable pull switches meets the safety performance requirements of SIL CL 2 per IEC 62061:2005 and has Category 3 structure that can be used in systems requiring Performance Levels up to PLd per ISO 13849-1: 2006. The series connection of the Lifeline cable switches limits the circuit to SIL CL2 and Category 3. This circuit executes a Category 0 stop.



Circuit Status

The first, third and fourth gates are closed. The second gate is open. The MSR127 safety relay S12 and S52 inputs are open due to the open gate, and therefore, the MSR127 safety outputs are open. The machine control PLC has a 24V auxiliary signal at terminal I1 from the second gate because the gate is open. The 1st, 3rd and 4th auxiliary signals are off, as their gates are closed. The PLC also has an auxiliary signal from the MSR127 indicating that the safety system is not ready. The motor is off.

Operating Principle

STARTING: Closing the second gate satisfies the input of the MSR127. The MSR127 verifies that both K1 and K2 contactors are off and energizes its safety outputs. Pressing the start button energizes the motor. The Stop/Start circuit is not part of the safety system and can be replaced by the machine control system (e.g., a PLC).
STOPPING: Press the Stop button to turn the motor off, without affecting the status of the safety system. Opening any of the gates will cause the safety system to stop the motor.

Fault Detection

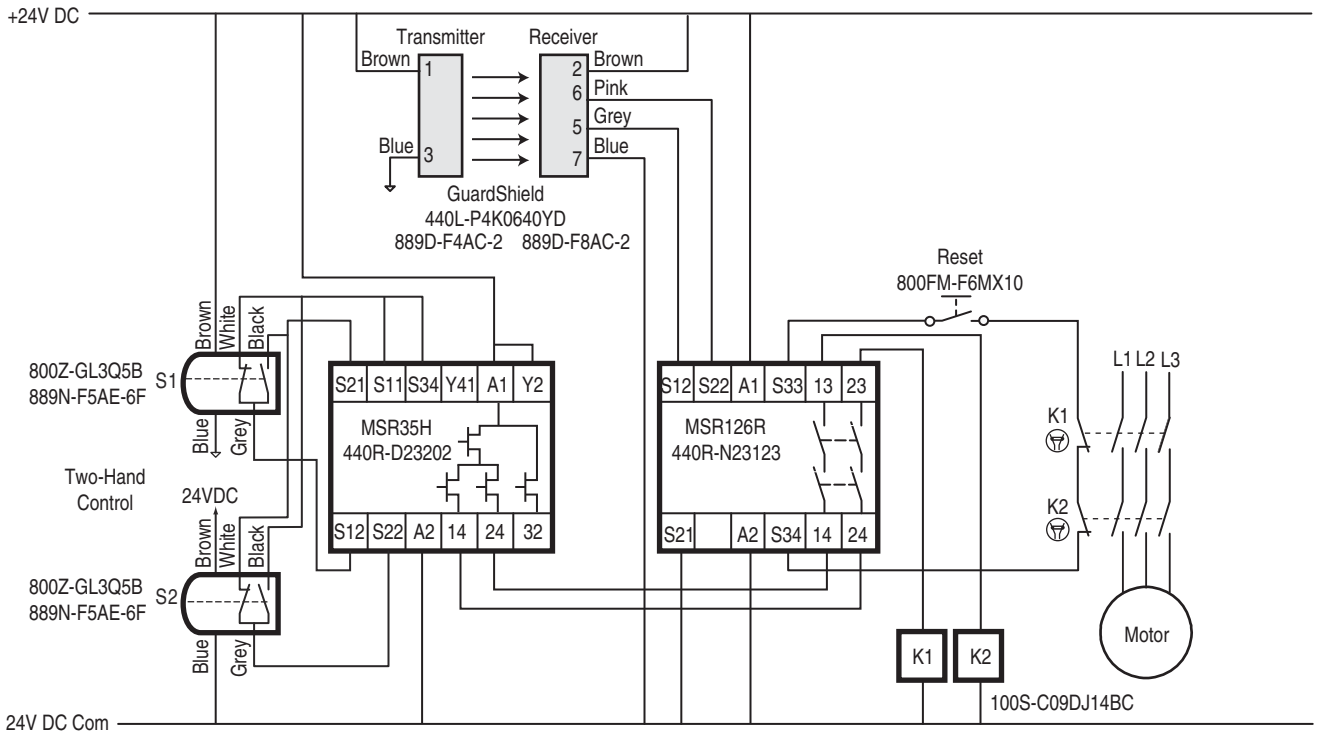
Upon successful completion of internal checks on power up, the SensaGuard interlocks check for 24V at pins 4 and 8. If the actuator is within range, the SensaGuard will activate its OSSD outputs. The OSSD outputs perform continuous checking for short circuits to 24V, ground and crossfaults. Upon detection of a fault, the OSSD outputs turn off. The MSR127 also performs internal checks on power-up. It then checks for input signals. If okay, the MSR127 checks the S12/S34 monitoring circuit to determine whether both contactors are off. If one of the contactors gets stuck on, the other contactor will de-energize the motor, and the MSR127 will detect the fault at the next attempt to start the motor. The contactors have mechanically linked auxiliary contacts to help ensure fault detection of the contactors. Contactors K1 and K2 are controlled by the safety system. Contactor K2 is controlled by both the machine control system and the safety system. This increases the probability of performance of the safety function because K1 is significantly less likely to weld at the same time as K2 due to the diversity of expected wear out times.

Ratings

The safety function initiated by the Lifeline cable pull switches meets the safety performance requirements of SIL CL 2 per IEC 62061:2005 and has Category 3 structure that can be used in systems requiring Performance Levels up to PLd per ISO 13849-1: 2006. When a device with two mechanically operated contacts is connected in series with the SensaGuard, the maximum rating is Category 3. If the Trojan 5 GD2 were removed from the circuit, the safety performance meets the requirements of Category 4. The SensaGuard interlocks are designed to meet Category 4 when connected in series. The MSR127 is rated to Category 4. The design and connection of the contactors meets category 4. This example circuit performs a Stop Category 0 function (coast to stop).

Light Curtain & Two-Hand Control—Punch Press

GuardShield, 800Z, MSR35H, MSR126, 100S



Circuit Status

The operator's hands are not on the two 800Z palm buttons. The outputs of the MSR35H are off. The light curtain is configured with the factory default settings (Guard only mode) and is unobstructed. The outputs of the MSR126R safety relay are off. The motor is off and ready to run.
The light curtain is protecting one portion of the machine. An operator, using two-hand control is accessing a different portion of the machine and has full view of his or her area.

Operating Principle

STARTING: Press the Reset button to energize the output of the MSR126. The operator places both hands on the 800Z buttons simultaneously (within 0.5 s). The outputs of the MSR35H (terminals 14, 24) energize the 100S contactors, which start the motor.
STOPPING: Removing one or both hands from the 800Z palm buttons causes the outputs of the MSR35H to turn off, which drops out K1 and K2 and stops the motor. Obstructing the light curtain de-energizes the safety outputs of the MSR126R, which in turn drops out K1 and K2 and turns the motor off. Clearing the light curtain does not restart the motor, even if the operator has their hands on the palm buttons. The reset button must be pressed after the light curtain is cleared.

Fault Detection

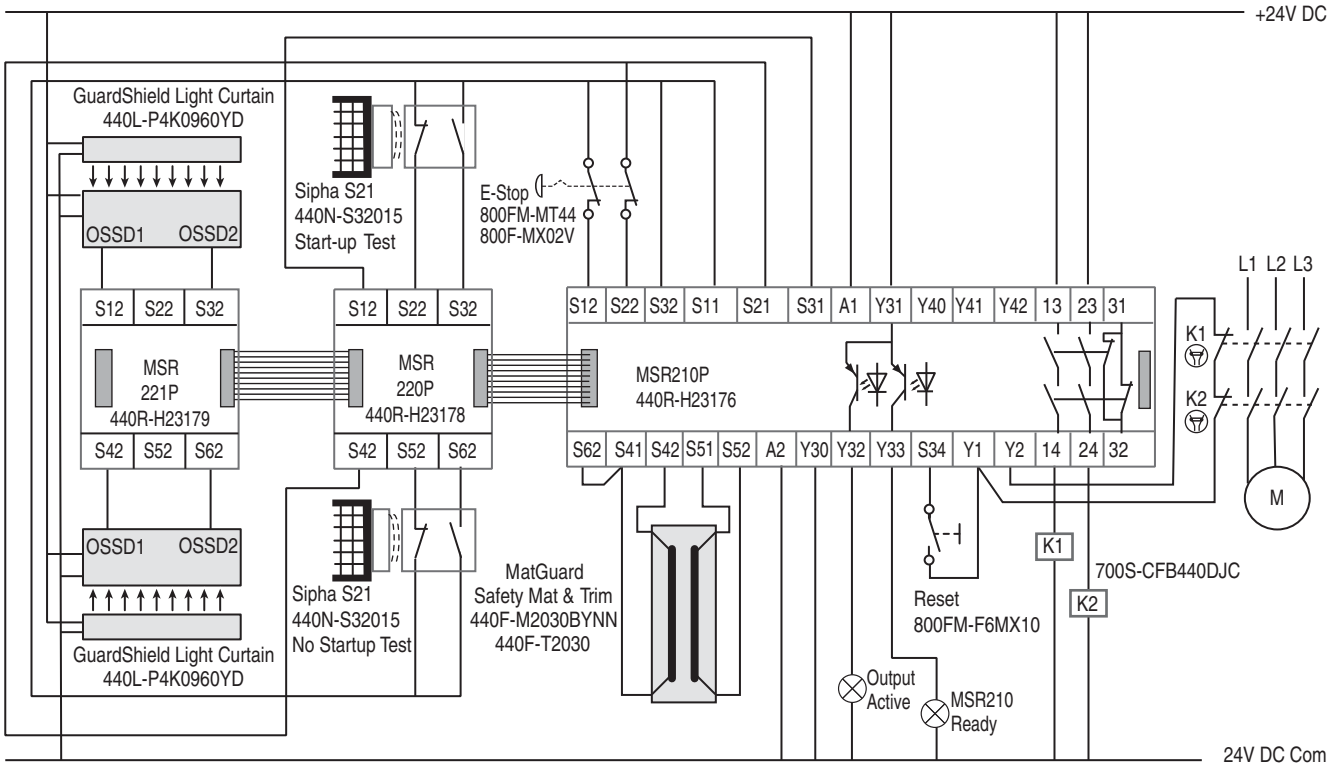
Upon power up, the 800Z, GuardShield, MSR35H and MSR126 perform internal checks. After passing internal checks, the MSR35H waits for a change of state of its inputs. Faults (opens and shorts) at the inputs will be detected by the MSR35H and prevent the outputs from being energized. The GuardShield light curtain also performs checks on its OSSD output signals for crossfaults, shorts and opens. The MSR126 looks for dual signals at its inputs. It then checks the status of the contactors. If one contactor fails in the actuated state, the other contactor will stop the motor. The MSR126 will detect if one of the contactors are stuck in the energized position, and prevents restart.

Ratings

The safety function initiated by the light curtain meets the safety performance requirements of SIL CL 3 per IEC 62061:2005 and has a Category 4 structure, which can be used in systems requiring Performance Levels up to PLe per ISO 13849-1: 2006. The safety function initiated by the 800Z palm buttons meets the safety performance requirements of SIL CL 2 per IEC 62061:2005 and has a Category 3 structure that can be used in systems requiring Performance Levels up to PLd per ISO 13849-1:2006. This circuit executes a Category 0 stop.

Configurable Relay—Two Zones

GuardShield, Sipha, MatGuard, 800F, MSR310P, MSR320P, 100S, 700S



Circuit Status

The light curtains are unobstructed. The safety gates are closed. The e-stop is reset and the safety mat is unoccupied. The MSR210 outputs are off. The motor is ready to run.

Operating Principle

The MSR200 is chosen as the safety relay for its modularity and ability to handle diverse devices, and to allow each device to be connected to individual inputs. The MSR200 has communication modules (not shown) to allow individual status information to be transmitted to the machine control system.
STARTING: Press the reset button to energize the outputs of the MSR210 and turn the motor on.
STOPPING: Activating any one of the safety devices (light curtain, e-stop, safety mat, or gate) de-energizes the MSR210 outputs and the motor coasts to a stop. If a safety device is activated, the motor cannot start.

Fault Detection

Upon successful completion of internal checks on power up, the MSR210P checks the input circuits. Shorts from the inputs to power, to ground or to other inputs will be detected immediately by the MSR210P and will prevent energization or will de-energize all of its outputs. If one of the 700S safety control relays (K1 or K2) fails in an actuated state, the motor will be able to stop by the 2nd relay (K2 or K1). This type of fault will be detected by the MSR210P on the next attempt to restart, and the MSR210P will not energize its outputs when the reset button is pressed. Upon power-up, one of the safety gates must be opened and closed to confirm proper operation.

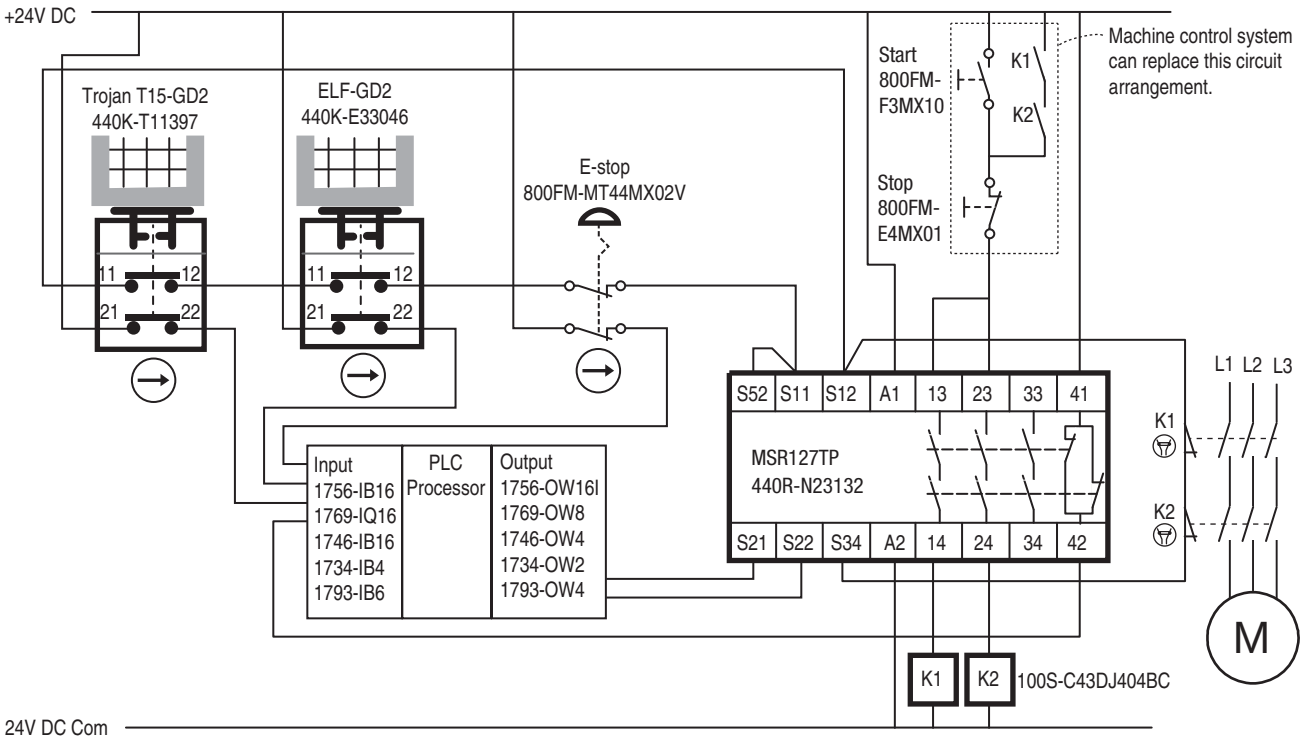
Since the noncontact sensor uses a N.O. contact, a broken wire may exist prior to usage. A startup test confirms the operation of the N.O. contact. For Start-up test, connect terminal S12 or S42 to terminal S31. If startup test is not desired, connect S12 or S42 to S21. With the start-up test, the gates must be opened and closed to confirm operation of both the N.O. and N.C. contacts. After successful completion of the start-up test, the reset button must be pressed momentarily to energize the outputs of the MSR210P.

Ratings

The safety functions initiated by the GuardShield light curtains, Sipha non-contact interlocks, and the 800F e-stop button meet the safety performance requirements of SIL CL 3 per IEC 62061:2005 and has Category 4 structure that can be used in systems requiring Performance Levels up to PLe per ISO 13849-1: 2006. The safety functions initiated by the safety mat are limited to SIL CL 2 and Category 3, PLd. This example circuit performs a Stop Category 0 function (coast to stop).

Interlock Switches—Multiple Gate Access

Trojan T15, Elf-GD2, 800F, MSR127, 100S



Circuit Status

Circuit shown with the safety gates closed and e-stop released. The safety relay is de-energized. The motor is off.

Operating Principle

With 2 N.C. + 1 N.O. interlocks, a potential exists for the gate to be slightly open which results in the auxiliary contact being closed and the safety being open. The machine cannot start and the PLC does not know which gate is open. By sending the second safety channel through the PLC, the machine control system knows which door is open, when the safety system is off due to a gate that may be slightly open. The infinite simultaneity feature of safety relays like the MSR127 allow enough time for the PLC to process all the gates and close the second channel of the safety relay without creating a lockout condition.

When a safety gate is opened, the interlock opens Ch1 directly to the safety relay and opens Ch2 which is connected to the input of a PLC. The PLC must then open Ch2 of the safety relay. The logic in the PLC must open the Ch2 signal if any one or more of the safety gates are open and must only close the Ch2 circuit when all of the safety gates and e-stop are closed. The PLC can also use the information on the inputs on PanelView or similar device. The auxiliary signal (41/42) from the MSR127 must be an input to the PLC. This PLC program must only close its output when all the safety inputs are closed and the auxiliary signal from the MSR127 is closed. This allows the PLC to indirectly confirm that its own output is working properly.

STARTING: Channel 1 input (S11/S12) of the MSR127 is satisfied. Using isolated relay contacts in its output module, the PLC closes the second safety channel (21/22 of the MSR127). The safety outputs of the MSR127 close. Press the Start button to start the motor.
STOPPING: Opening any one of the safety gates or pressing the e-stop causes the motor to turn off. Closing the gate or releasing the e-stop does not cause the motor to start due to the start-stop interlocking circuit. To restart the motor, close the safety gate or release the e-stop. Then press the start button.

Fault Detection

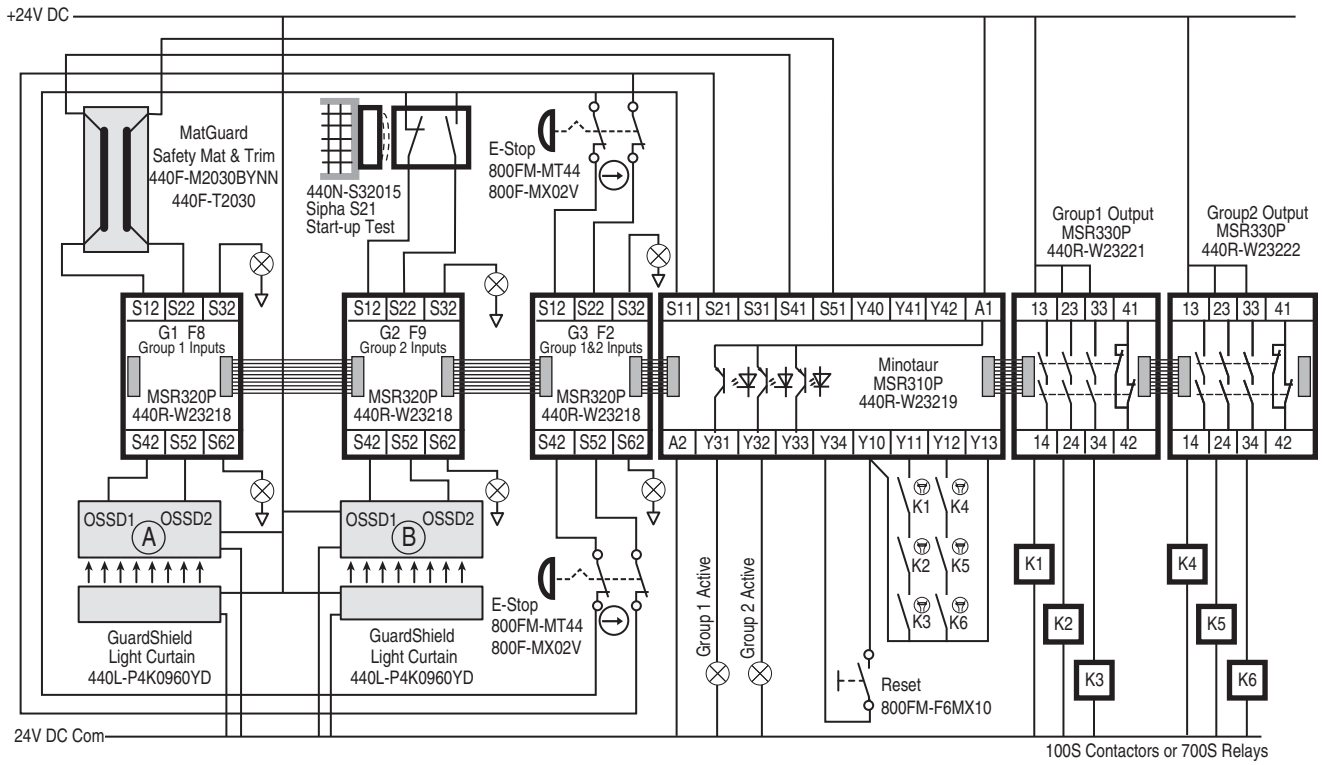
If the PLC fails with its output closed, the safety relay will detect the difference between the safety gate and the PLC and stop the motor. A single fault (open or short) across one of the interlocks will be detected by the safety relay and the motor will be turned off. The motor will remain off until the fault is corrected or power is cycled. If either contactor K1 or K2 sticks ON—the motor will stop on command due to the other contactor, but the MSR127 cannot be reset (thus the fault is revealed to the operator). A single fault detected on the MSR127 input circuits will result in the lock-out of the system to a safe state (OFF) at the next operation of the safety gate or e-stop device.

Ratings

The safety function initiated by the Trojan T15 safety gate interlocks and the 800F e-stop meets the safety performance requirements of SIL CL 2 per IEC 62061:2005 and has a Category 3 structure that can be used in systems requiring Performance Levels up to PLd per ISO 13849-1: 2006. This circuit executes a Category 0 stop.

Configurable Relay—Two Zones

GuardShield, Sipha, MatGuard, 800F, MSR310P, MSR320P, 100S, 700S



Circuit Status

The light curtains are unobstructed. The safety gate is closed. The e-stops are reset, and the safety mat is unoccupied. The MSR330P outputs are off. K1-K6 are ready to be energized.

Operating Principle

The MSR300 is chosen as the safety relay for its zoning capability. The two e-stops operate globally—turning off both sets of outputs for Groups 1 and 2. The light curtain A and safety mat control the outputs of Group 1. The light curtain B and safety gate control the outputs of Group 2. With no connections to Y40-Y42, all outputs have monitored manual reset.

STARTING: Press the reset button to energize all MSR330P outputs.

STOPPING: Obstructing the light curtain A or stepping on the safety mat turns off the Group 1 outputs while leaving the Group 2 outputs energized. The reset button must be pressed to re-energize the Group 1 outputs after light curtain A and safety mat are cleared. Obstructing the light curtain B or opening the safety gate turns off the Group 2 outputs. The reset button must be pressed to re-energize the Group 2 outputs after light curtain B is cleared and the safety gate is closed. Pressing either e-stop de-energizes both Group 1 and Group 2 outputs. The e-stop must be released and the reset button must be pressed to re-energize the Group 1 and 2 outputs.

Fault Detection

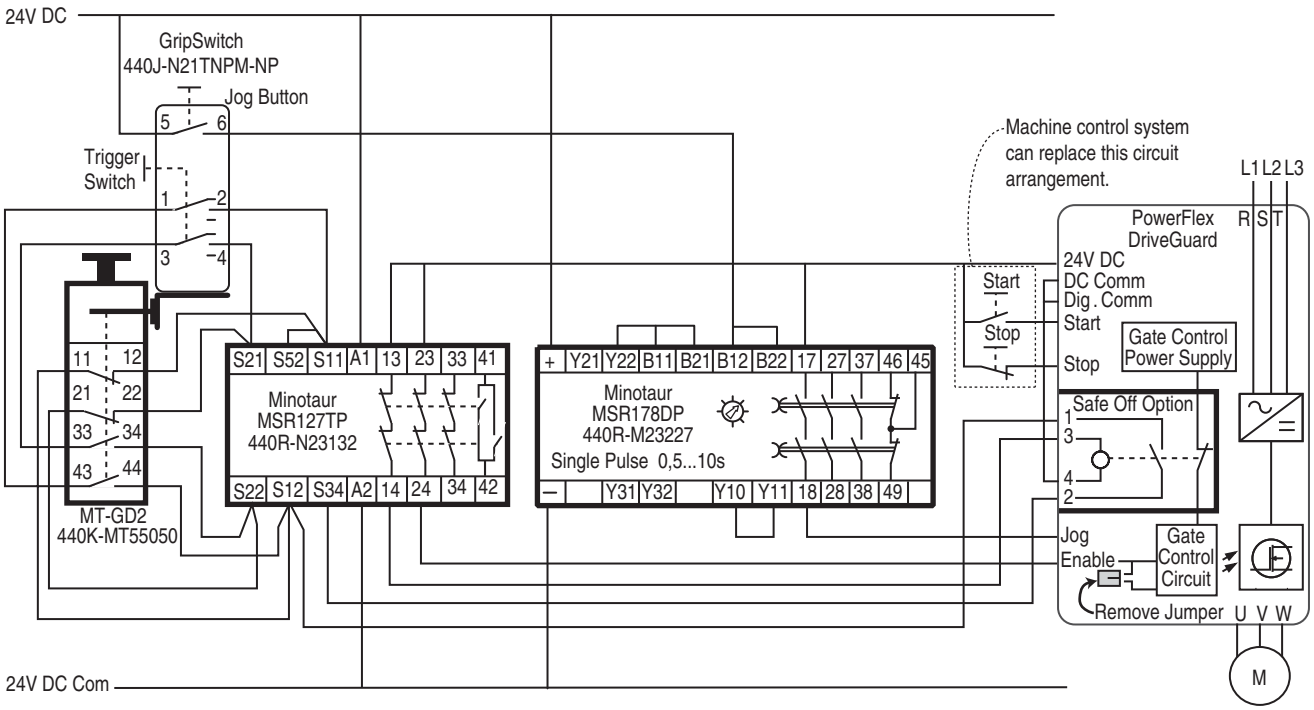
Upon successful completion of internal checks on power up, the MSR310P checks the input circuits. Shorts from the inputs to power, ground or other inputs will be detected immediately and will prevent energization or will de-energize the MSR330P outputs. If one of the 100S or 700S output devices (K1-K6) is stuck in an actuated state, the MSR310P will prevent startup because the Y11 or Y12 feedback loop will remain open.

Ratings

The rating assumes that two contactors are connected in series to power a hazard (not shown). The safety function initiated by the GuardShield light curtains, Sipha interlocks and 800F e-stop meet the safety performance requirements of SIL CL 3 per IEC 62061:2005 and has a Category 4 structure that can be used in systems requiring Performance Levels up to PLe per ISO 13849-1: 2006. The safety function initiated by MatGuard safety mats meet the safety performance requirements of SIL CL 2 per IEC 62061:2005 and has a Category 3 structure that can be used in systems requiring Performance Levels up to PLd per ISO 13849-1:2006. This circuit executes a Category 0 stop.

Enabling Device & Drive—Safe Jog

440G-MT, GripSwitch, MSR127, MSR178, PowerFlex DriveGuard



Circuit Status

The 440J GripSwitch is held by the MT-GD2. The MSR127 safety outputs are closed. The PowerFlex Enable and Safe-off option are energized. The MSR178 safety outputs are de-energized. The motor is ready to run.

Operating Principle

The MSR178 is chosen for its ability to perform timing functions. In this case, the MSR178 is set up to jog the PowerFlex drive with a single pulse having a duration set between 0.5 to 10 s (no jumpers form Y10 to Y31 or Y32 and fine adjustment made by potentiometer on front of MSR178). While in the MT-GD2 holder, the GripSwitch is disabled, and the drive can be controlled by the machine control system (not shown).

STARTING: Close the three-position trigger switch to the mid-position. Remove the enabling switch from the MT-GD2 holder. Press and hold the Jog button on the GripSwitch to initiate the operation of the MSR178. The MSR178 closes its safety outputs for the set duration.

STOPPING: The jog function stops after the set time expires. To restart, momentarily release the jog button and then re-close it to repeat the jog. Releasing or squeezing the three-position switch opens the outputs of the MSR127, and the PowerFlex drive executes a coast to stop.

Fault Detection

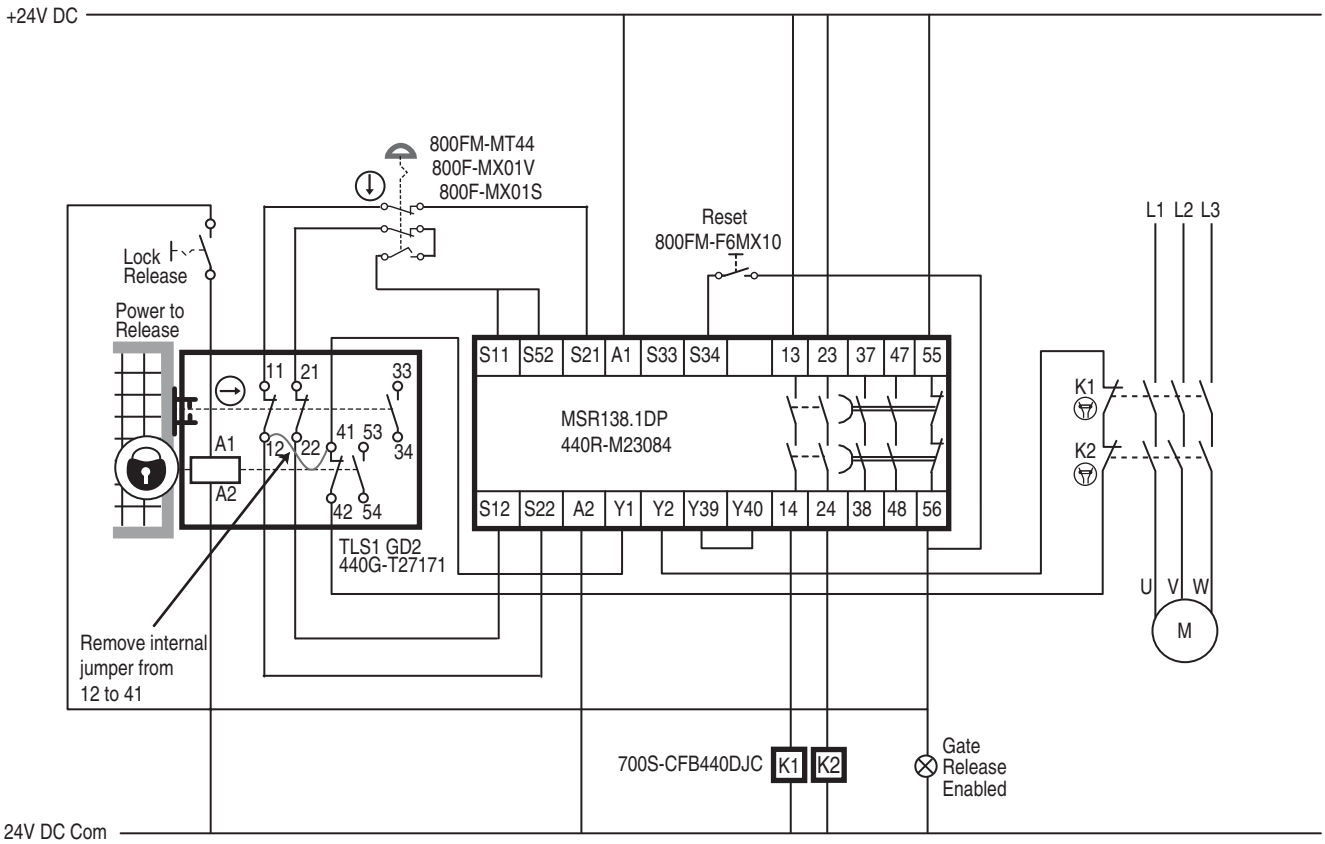
Upon successful completion of internal checks by the MSR127, MSR178 and the PowerFlex drive, the drive awaits the closure of the MSR127 safety outputs. If the MSR127 fails, the drive will not energize the motor and the fault will be detected by non-operation of the motor. The MSR127 uses dual channel to detect faults to power, ground and cross channel faults on the GripSwitch or the MT-GD2. A short across the jog switch will be detected as a subsequent jog attempt will be prevented by the MSR178. A fault in the Safe-Off option of the drive will be detected by the MSR127 on the next attempt to restart the drive. Internal faults in the MSR127 will result in non-operation of the motor. Internal faults of the MSR178 will result in non-operation of the jog function.

Ratings

The safety function initiated by GripSwitch enabling device meets the safety performance requirements of SIL CL 2 per IEC62061:2005 and has a Category 3 structure that can be used in systems requiring Performance Levels up to PLd per ISO13849-1:2006. This circuit executes a Category 0 stop.

Interlock Switches—Guard Locking with Time Delay

800F, MSR138, TLS1 GD2, 700S



Circuit Status

The e-stop is reset and the safety gate is closed. The outputs of the safety relay are open and the motor is off.

Operating Principle

STARTING: Press the Reset button to energize the outputs of the MSR138. The immediate outputs of the MSR138 energize the 700S control relays and start the motor.
STOPPING: When the e-stop is pressed, the immediate outputs of the MSR138 open and the motor coasts to stop. After the time delay of the MSR138 expires, the delayed N.C. output closes and provides voltage to the Lock Release button. Press the Lock Release button to power the solenoid and open the Gate.

Closing the Gate or resetting the e-stop does not re-energize the 700S safety control relays. Press the reset to re-energize the 700S control relays.

Fault Detection

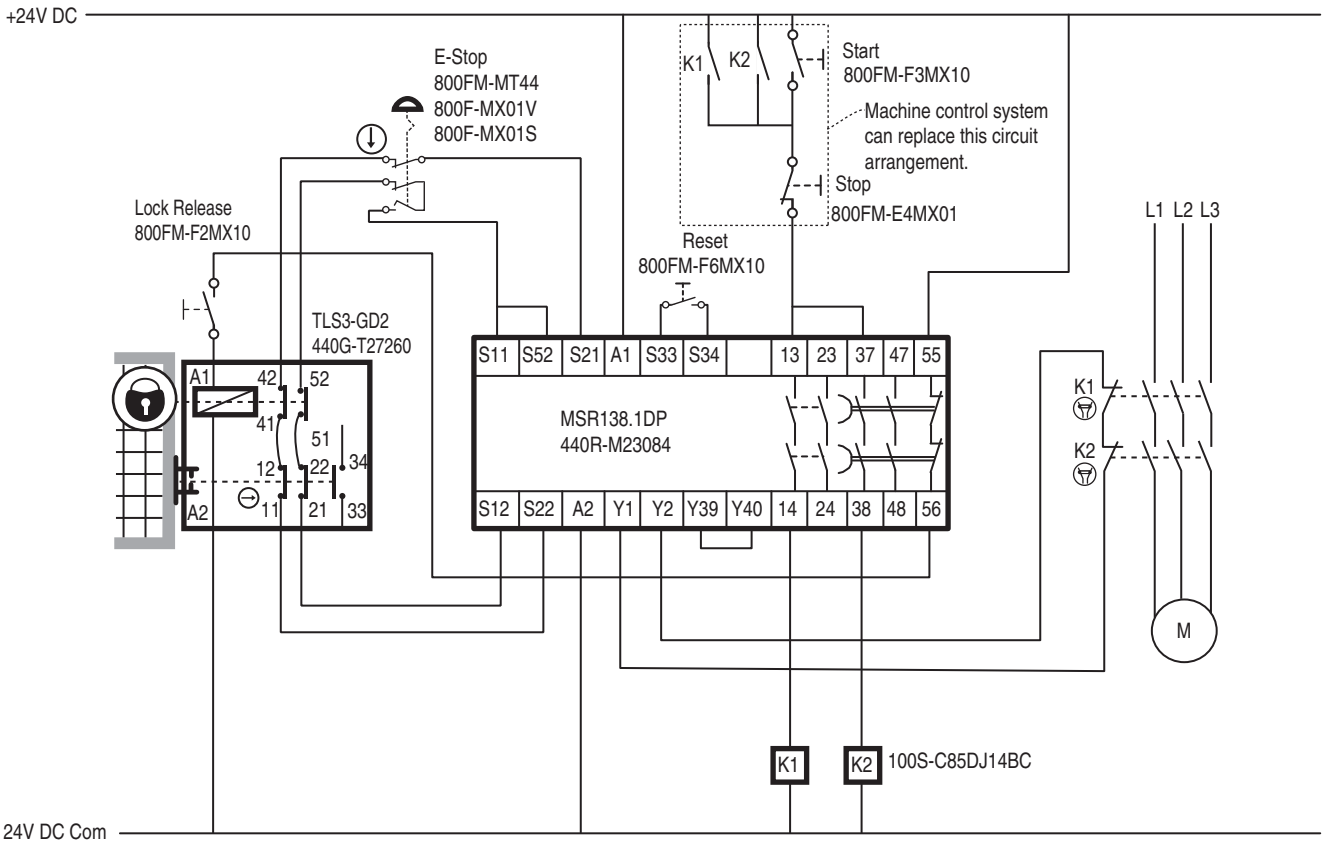
Upon power-up, the MSR138 perform internal checks. The MSR138 then looks for dual signals from the e-stop and the TLS1 GD2. The e-stop has a self-monitoring contact, which opens if the contact block falls off the control panel. With the e-stop signals made, the MSR138 checks the Y1/Y2 monitoring circuit when the reset button is pressed. If these checks are okay, the output energizes. The Reset button is linked to the delayed N.C. output in order to supply +24V for reset only when delay time has lapsed. If any of the MSR138 contacts faults to the ON state, the motor is stopped by the redundant outputs. The fault will be detected by the S56/S34 monitoring circuit on the next attempt to re-start. If the Gate is not interlocked by the TLS1 solenoid or one of the 700S control relays faults to the ON state, the MSR138 will detect the fault in the Y1/Y2 circuit on the next attempt to start. Single point failures related to the tongue interlock are excluded if actuator speed, alignment and mechanical stops meet installation instruction requirements, and a periodic proof test confirms proper operation.

Ratings

The safety function intiated by TLS1-GD2 guard locking interlock and the 800F e-stop meets the safety performance requirements of SIL CL 2 per IEC 62061:2005 and has a Category 3 structure that can be used in systems requiring Performance Levels up to PLd per ISO 13849-1:2006. This circuit executes a Category 0 stop.

Interlock Switch—Guard Locking with Time Delay

TLS3-GD2, 800F, MSR138, 100S



Circuit Status

The e-stop is reset and the safety gate is closed. The outputs of the safety relay are open, and the motor is off.

Operating Principle

The guard locking interlock and delayed outputs of the safety relay keep the guard closed and locked during the rundown time of the motor.
STARTING: Press the reset button to energize both the immediate and delayed outputs of the MSR138. Press the start button to energize contactors K1 and K2, which start the motor.
STOPPING: Press the e-stop to initiate a stop command. The immediate outputs of the MSR138 de-energize and the MSR138 timing cycle starts. Contactor K1 drops out and the motor begins a coast to stop. After the time delay of the MSR138 expires, the N.C. output closes and provides voltage to the lock release button. Press the lock release button to power the solenoid and open the gate. After the time delay, the normally open safety contact opens, dropping out K2.

Fault Detection

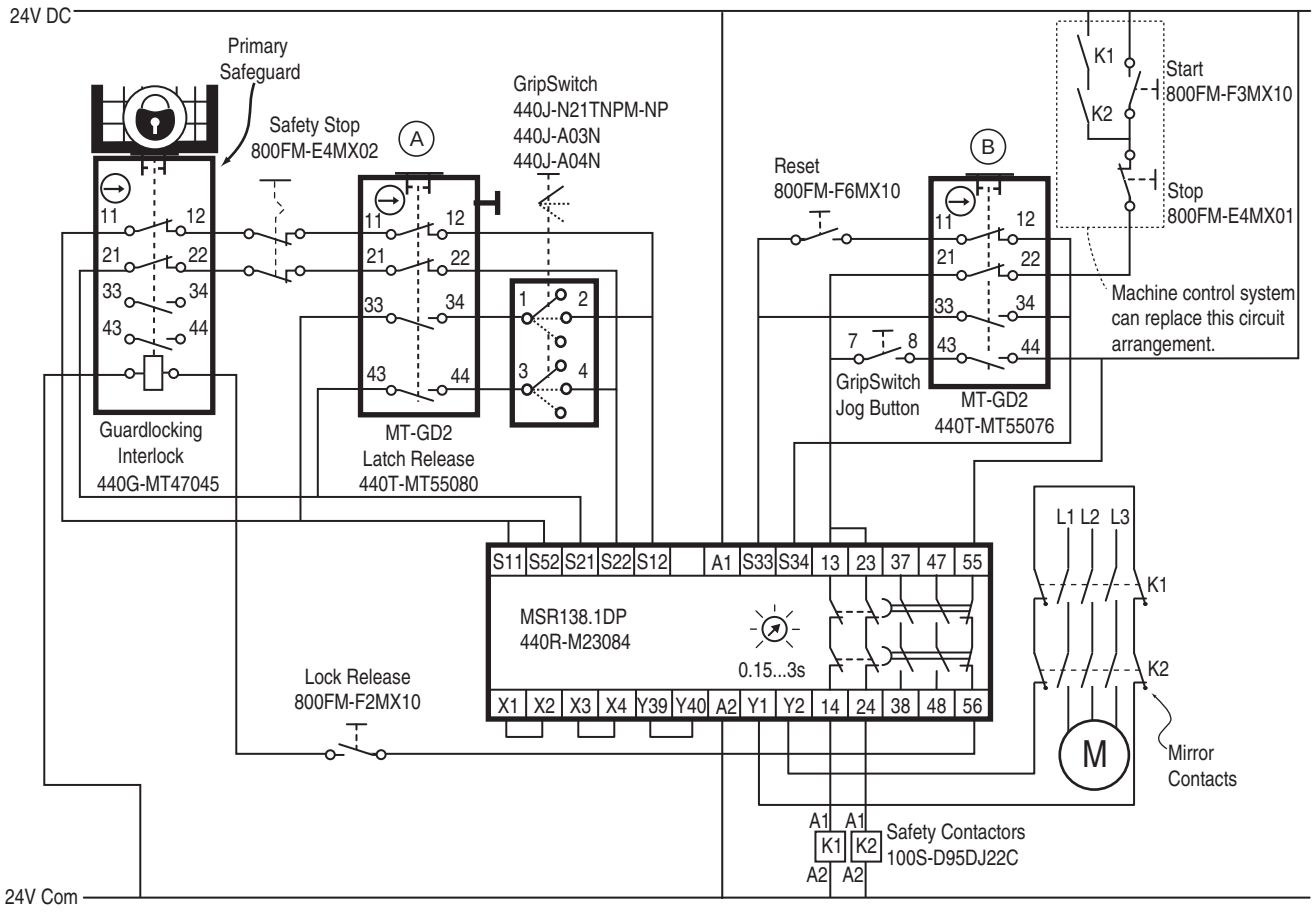
Upon power-up, the MSR138 performs internal checks. The MSR138 then looks for dual signals from the e-stop and the TLS3 GD2. The e-stop has a self-monitoring contact, which opens if the contact block falls off the control panel. With the e-stop signals made, the MSR138 checks the Y1/Y2 monitoring circuit when the reset button is pressed. If these checks are OK, the output energizes. If any of the MSR138 contacts faults to the ON state, the motor is stopped by the redundant outputs. The fault will be detected by internal crosschecking in the MSR138. With K1 on the immediate output of the MSR138, if performs the primary breaking of the motor circuit. If K1 fails due to welded contacts, the K2 will break the motor circuit. The failure of K1 will be detected by the Y1/Y2 monitoring circuit on the next attempt to restart the motor. Single point failures related to the tongue interlock are excluded if actuator speed, alignment and mechanical stops meet installation instruction requirements, and a periodic proof test confirms proper operation.

Ratings

The safety function initiated by the TLS3-GD2 guard locking interlock and the 800F e-stop button meets the safety performance requirements of SIL CL 2 per IEC 62061:2005 and has Category 3 structure that can be used in systems requiring Performance Levels up to PLd per ISO 13849-1: 2006. This example circuit performs a Stop Category 0 function (coast to stop).

Interlock Switch and Enabling Device—Guard Locking with Time Delay

GripSwitch, MT-GD2, 400G-MT, 800F, MSR138, 100S



Circuit Status

The 440J GripSwitch is held by two MT-GD2 tongue interlocks by its mounting plate accessories. The safety gate is closed and the 440G-MT guard locking interlock is locked. The MSR138DP safety outputs are open. Contactors K1 and K2 are de-energized. The motor is off and the application ready to run.

Operating Principle

The GripSwitch enabling device is used to access the hazardous area while the motor is running. The access is of the full body type. With the safety gate unlocked, the operator walks into the hazardous area with the GripSwitch. Before accessing the hazard area, the motor must be stopped. After entering the hazard area, the motor can be restarted with the GripSwitch. One MT-GD2 interlock is used to bypass the gate interlock safety circuit. The other MT-GD2 is used to reset the safety system and prevent the starting of the motor from outside the cell, when the GripSwitch is used.

STOPPING: Press the Safety Stop. The immediate outputs of the MSR138.1DP open and the motor initiates a coast to stop. After the time expires on the MSR138.1DP, the delayed outputs change state. The contacts across 55 and 56 close and the safety gate can be unlocked. Press the lock release button to momentarily power the solenoid of the 440G-MT and open the gate.
STARTING: Remove the enabling switch from the MT-GD2 holders. Squeeze the GripSwtich trigger to the middle position. The MSR138.1DP resets and closes its safety outputs and the motor is ready to run. Press the jog button on the GripSwitch to momentarily turn on the motor.
STOPPING DURING ENABLING: Release the jog switch to stop the motor. Releasing or applying further pressure to the trigger switch on the GripSwitch will stop the motor.

Fault Detection

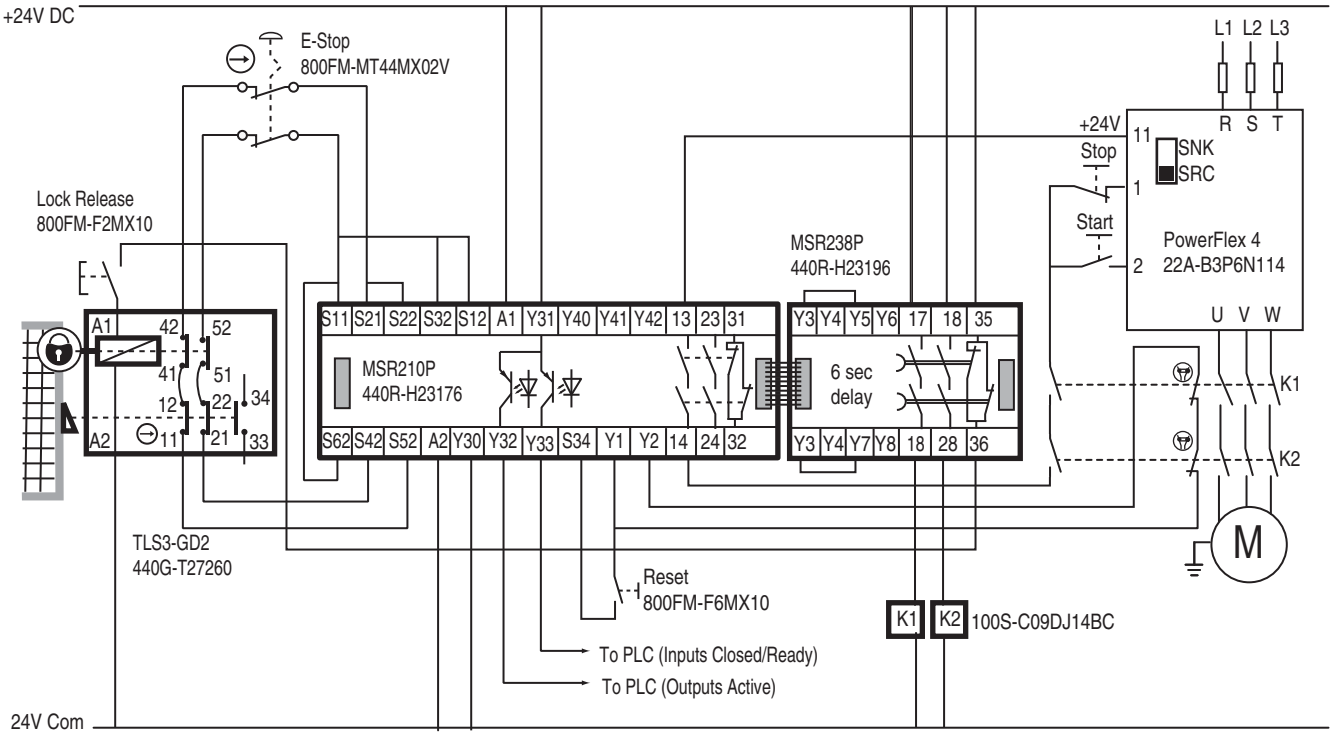
Upon successful completion of internal checks on power-up, the MSR138.1DP checks the gate and GripSwitch circuit. If both circuits have been closed, the MSR138.1DP checks the reset circuit. Upon closure of the reset button, the MSR138.1DP checks the status of the contactors. Due to the size of the 100S-D contactors, mirrored contacts (on either side of the unit) are used to safely reflect the staus of the armature. If all mirrored contacts are closed, then the MSR138.1DP energizes its outputs. If one contactor welds in the closed state, the second contactor will shut off the motor and the fault will be detected by the MSR138.1DP, upon the next attempt to start the motor. Single channel faults on the input devices (GripSwitch, Interlocks and Stop switch) will be detected by the MSR138.1DP either on or before a demand is placed on the safety system (depending on the nature of the fault).

Ratings

The safety function initiated by the MT-GD2 guard locking interlock and the GripSwitch button meets the safety performance requirements of SIL CL 2 per IEC62061:2005 and has Category 3 structure that can be used in systems requiring Performance Levels up to PLd per ISO 13849-1: 2006. This example circuit performs a Stop Category 0 function (coast to stop).

Interlock Switch & Modular Relay—Guard Locking with Standard Drive

TLS-GD2, 800F, MSR200, 100S, PowerFlex 4



Circuit Status

The guard door is closed and locked (mechanical lock, power to release). The e-stop is released. K1 and K2 are off. The drive is powered, but not enabled. The motor is off.

Operating Principle

Access to the hazard is prevented (i.e., locked) by the guard locking TLS3-GD2 while the motor is running and for a fixed duration (controlled by the MSR238) after the e-stop command is initiated.

STARTING: Momentarily press the reset button. The contacts in the MSR210P and MSR238P close. K1 and K2 energize and connect the motor to the drive and also connects 24V to the start button. This ensures that the motor is connected to the drive, before the start button becomes effective. The PowerFlex 4 drive is allowed to start. Start the motor by momentarily pressing the start switch. The motor can be stopped by momentarily pressing the stop switch. The start and stop switches can be replaced by more elaborate control devices (like a PLC).

STOPPING: Press the e-stop. The MSR210P opens its immediate output (13-14) and begins the timing sequence in the MSR238. The PowerFlex 4 also begins its programmed deceleration as the stop signal is opened. After six seconds, the MSR238 times out and contacts 17-18 and 27-28 open. K1 and K2 de-energize and disconnect the motor from the drive. Contacts 35-36 close and provide power to the release button of the TLS3-GD2. Press and hold the release button to open the gate.

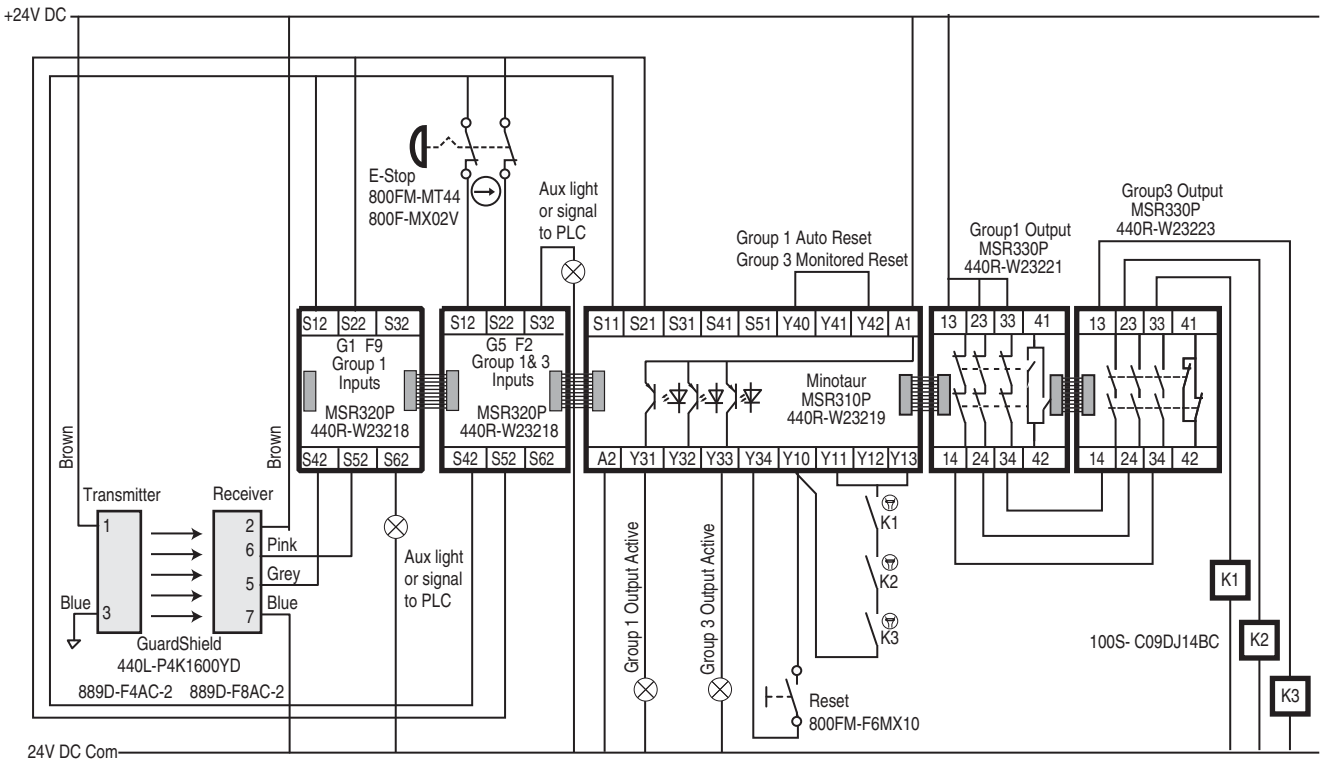
Closing the gate or releasing the e-stop will not cause the motor to turn on. Two separate and deliberate actions are needed: 1) momentarily press the reset button to activate the safety relay and then 2) momentarily close the start switch to turn the motor on. In this application, the user must ensure that the time delay of the MSR238P provides sufficient time for the hazards, driven by the motor, to stop. Ramping to stop or dynamic braking are recommended to speed up the braking process. The time delay of the MSR238P should be set longer than the stopping time of the PowerFlex 4 or the motor will coast to its final stop. The PowerFlex 4 will not be able to start while the K1 and K2 contactors are de-energized.

Fault Detection

If the drive output faults to an energized state, the motor can be turned off by pressing the e-stop. If K1 welds in an energized state, the motor can be stopped by K2. If either K1 or K2 welds closed, the MSR210P will not be able to start due to the feedback loop (Y1-Y2) being open. A short across the interlock or e-stop will be detected by the MSR210P. The MSR210P will also detect if the reset is held or stuck in the closed position, and will prevent the motor from starting.

Ratings

The safety function initiated by the TLS3-GD2 guard locking interlock and the 800F e-stop button meets the safety performance requirements of SIL CL 2 per IEC 62061:2005 and has Category 3 structure that can be used in systems requiring Performance Levels up to PLd per ISO 13849-1: 2006. This example circuit performs a Stop Category 1 function (brake and then remove power to motor).



Circuit Status

The light curtain is set at the factory default setting (guard only) and is unobstructed. The e-stop is reset. The Group 1 MSR330P safety outputs (13/14, 23/24, 33/34) are on. The Group 3 MSR330P safety outputs are off. K1-K3 are off and ready to be energized.

Operating Principle

Since the safety outputs of the two MSR330P modules are connected in series, both the light curtain and e-stop will control (turn on and off) the K1-K3 loads. The light curtain is set to automatic reset mode. The e-stop stop operates in monitored reset mode. The jumper from Y40 to Y42 sets the Group 1 output to automatic reset and the Group 3 output to monitored reset. The MSR310P must have the monitoring circuit connected to both Y11 and Y13 to allow both the Group1 and Group 3 outputs to energize.

STARTING: Press the reset button to energize the Group 3 outputs, which energize the loads K1-K3.

STOPPING: Obstructing the light curtain turns off the Group 1 safety outputs and de-energizes K1-K3. Clearing the light curtain automatically re-energizes K1-K3. This arrangement is known as presence sensing device initiation, and additional precautions (e.g., limited to partial body access, part sensing, limited speed) may be necessary to ensure safe operation of the machine. Pressing the e-stop turns off both the Group 1 and Group 3 safety outputs and de-energizes K1-K3. Resetting the e-stop re-energizes the Group 1 outputs, but the Group 3 outputs remain off. The Reset button must be pressed to turn on the Group 3 outputs and energize the loads K1-K3.

Fault Detection

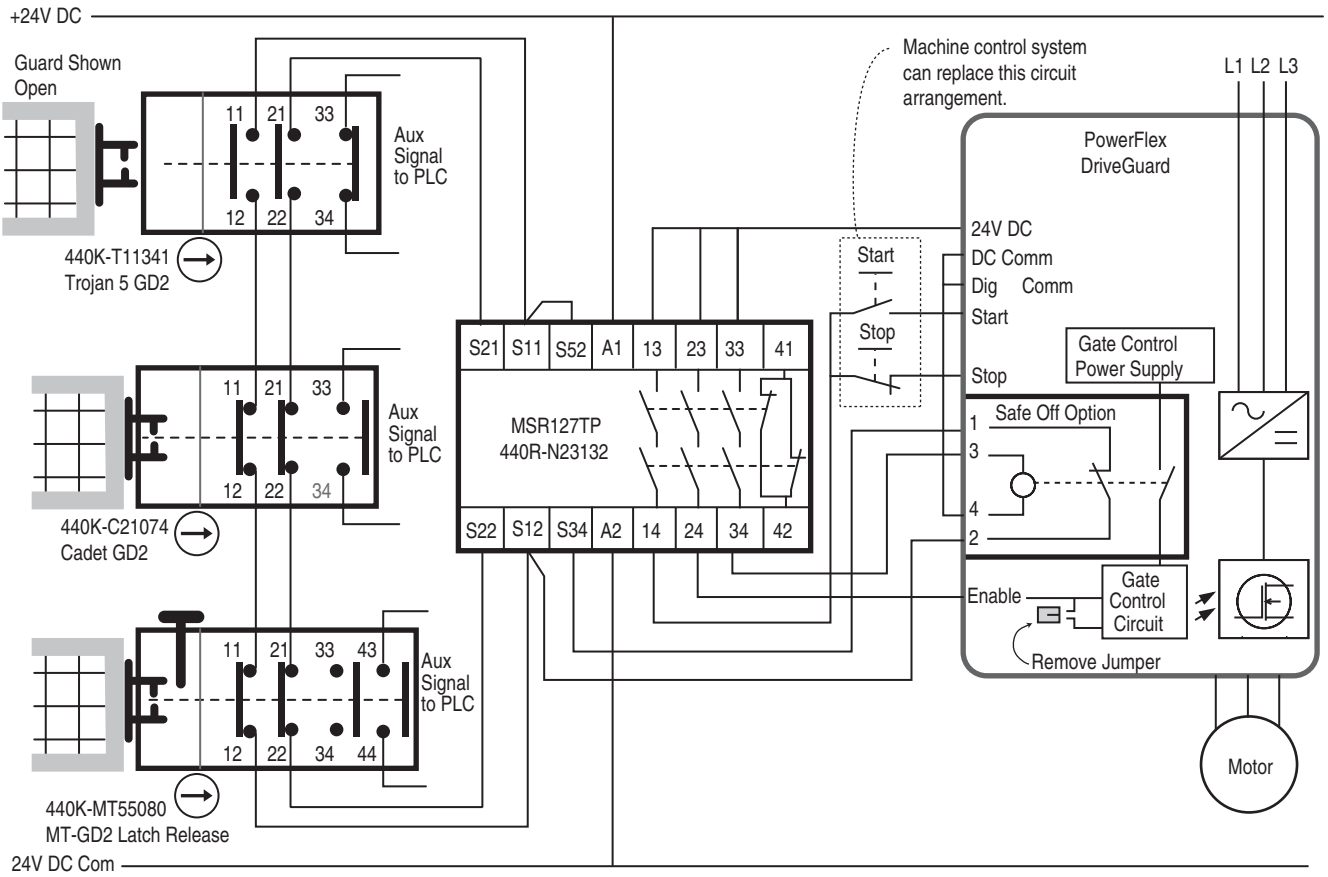
Upon successful completion of internal checks on power up, the GuardShield energizes its outputs. Cross-channel shorts and shorts to ground or power are detected by the GuardShield. The MSR310P also performs internal checks, and then scans the input circuits. The MSR310P uses pulse testing from S11 and S21 to detect shorts from the inputs to power, ground or other inputs. These faults will be detected immediately and will prevent energizating or will de-energize the MSR330P outputs. If one of the 100S output devices (K1-K3) is stuck in an actuated state, the MSR310P will prevent start-up because the Y10/Y11/Y13 feedback loop will remain open.

Ratings

When two contactors are connected in series to power a hazard (not shown), the safety functions intiated by GuardShield light curtains and the 800F e-stop meet the safety performance requirements of SIL CL 3 per IEC 62061:2005 and has a Category 4 structure that can be used in systems requiring Performance Levels up to PLe per ISO 13849-1:2006. If only one contactor is used to power a hazard, the safety function can meet SIL CL 2, Category 2 structure and PLd.

Drive—Multiple Gate Access

Trojan 5 GD2, Cadet GD2, MT-GD2, MSR127, PowerFlex DriveGuard



Circuit Status

One of the gates is open. The safety outputs of the MSR127 are de-energized. The PowerFlex with DriveGuard is de-energized and not enabled. The motor is off.

Operating Principle

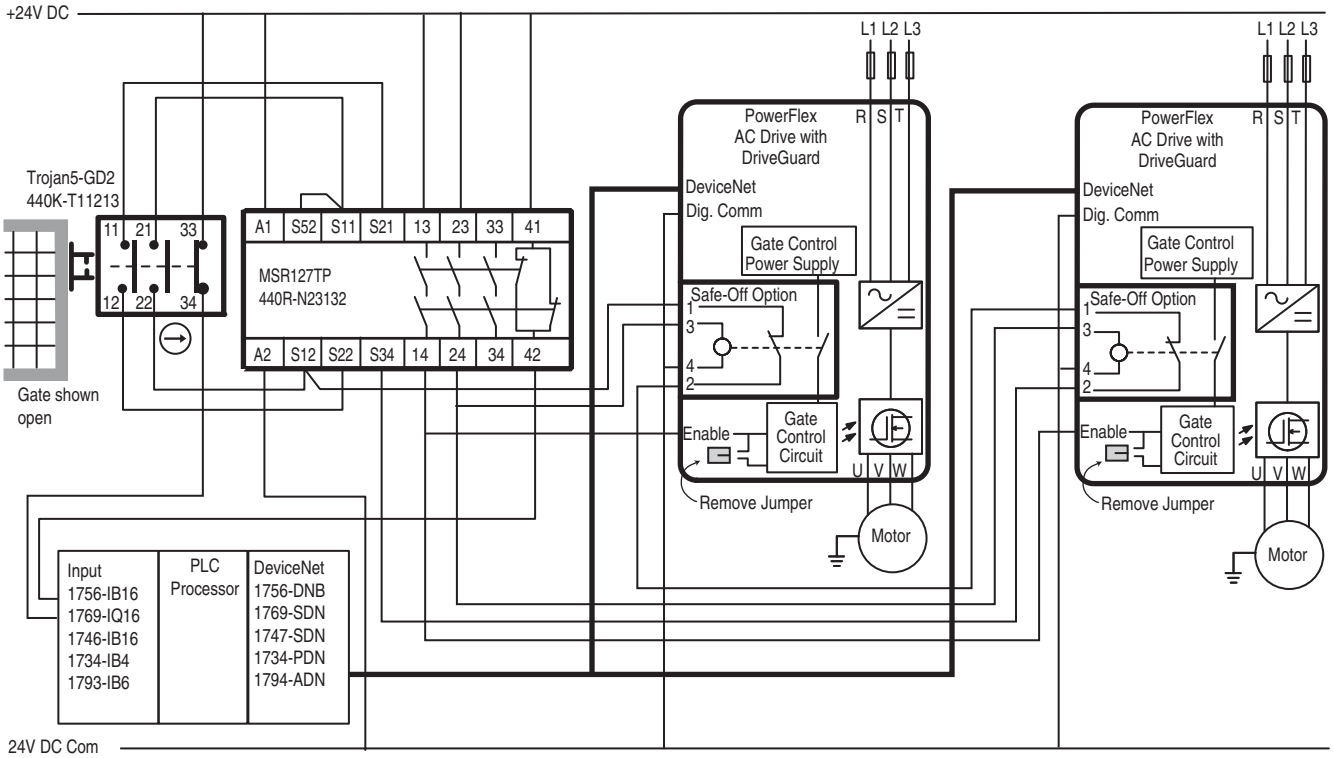
STARTING: When the last gate closes, the safety outputs of the MSR127 close and apply power to the drive enable circuit, Safe-Off option, Start and Stop buttons. Pressing the Start and Stop buttons turns the motor on and off. The motor is controlled by parameters set within the PowerFlex drive.
STOPPING: Opening any of the guard doors causes the MSR127 safety outputs to de-energize. This removes power to the PowerFlex enable, Safe-Off, Start, and Stop circuits. The motor performs a coast to stop.

Fault Detection

Upon power-up the PowerFlex drive and MSR127 perform internal checks. The MSR127 then looks for dual signals from the gate interlocks. With the gates closed, the MSR127 checks the wiring of the drive Safe-Off option. If closed, then the MSR127 energizes its outputs and the motor can be started. A single open circuit fault at the gate interlocks will be detected immediately, and the motor will coast to a stop. A crossfault (channel 1 to channel 2) at the gate interlocks will be detected immediately. A short across one gate interlock contact will be detected when an attempt to re-start is made. This type of short can be masked by opening and closing another gate interlock and may result in a loss of the safety function due to an accumulation of contact shorts. The MSR127 is rated for Category 4 and will not lose the safety function due to an accumulation of faults. The PowerFlex 70 DriveGuard is rated at Category 3, as it will perform the safety function in the presence of a single internal fault.

Ratings

The safety function intiated by gate interlocks meets the safety performance requirements of SIL CL 2 per IEC 62061:2005 and has a Category 3 structure that can be used in systems requiring Performance Levels up to PLd per ISO 13849-1:2006. This circuit executes a Category 0 stop.



Circuit Status

The safety gate is open. The MSR127TP safety outputs (13/14, 23/24, 33/34) are open. The Enable and Safe-Off Option on both PowerFlex drives are off. Auxiliary signals from the Trojan 5 GD2 (33/34) and the MSR127 (41/42) inform the PLC that the safety system is OFF. The motors of both drives are off.

This circuit is intended to show that multiple drives can be connected in parallel. The number of drives that can be connected in parallel is dependent on: the load (the safe-off option plus the enable of each drive), appropriate de-rating to prevent early wear out of the MSR127TP contacts, the application requirements (e.g., zoning) and the risk assessment (e.g., some drives may require separate safety systems).

Operating Principle

STARTING: Upon closing the gate, the Trojan 5 GD2 closes the safety inputs of the MSR127TP (S11/S12 and S21/S22) and opens the signal to the PLC. The safety outputs of the MSR127TP close and enable both PowerFlex drives. The auxiliary signal of the MSR127TP opens. The PLC compares the gate and safety relay auxiliary signals. When both signals are open, the PLC knows that the safety system is ready. The PLC can now start and control the drives over the DeviceNet network. The PLC must ensure that the drives are not started upon the closing of the gate; a separate, intentional action must initiate the motor movement (this is not shown in the diagram).
STOPPING: Normal stopping is performed by the PLC. If the gate is opened, the input signals to the MSR127TP open. The MSR127TP opens its safety outputs which disable all the drives connected to them via the Safe-Off option. The drives perform an immediate coast to stop.

Fault Detection

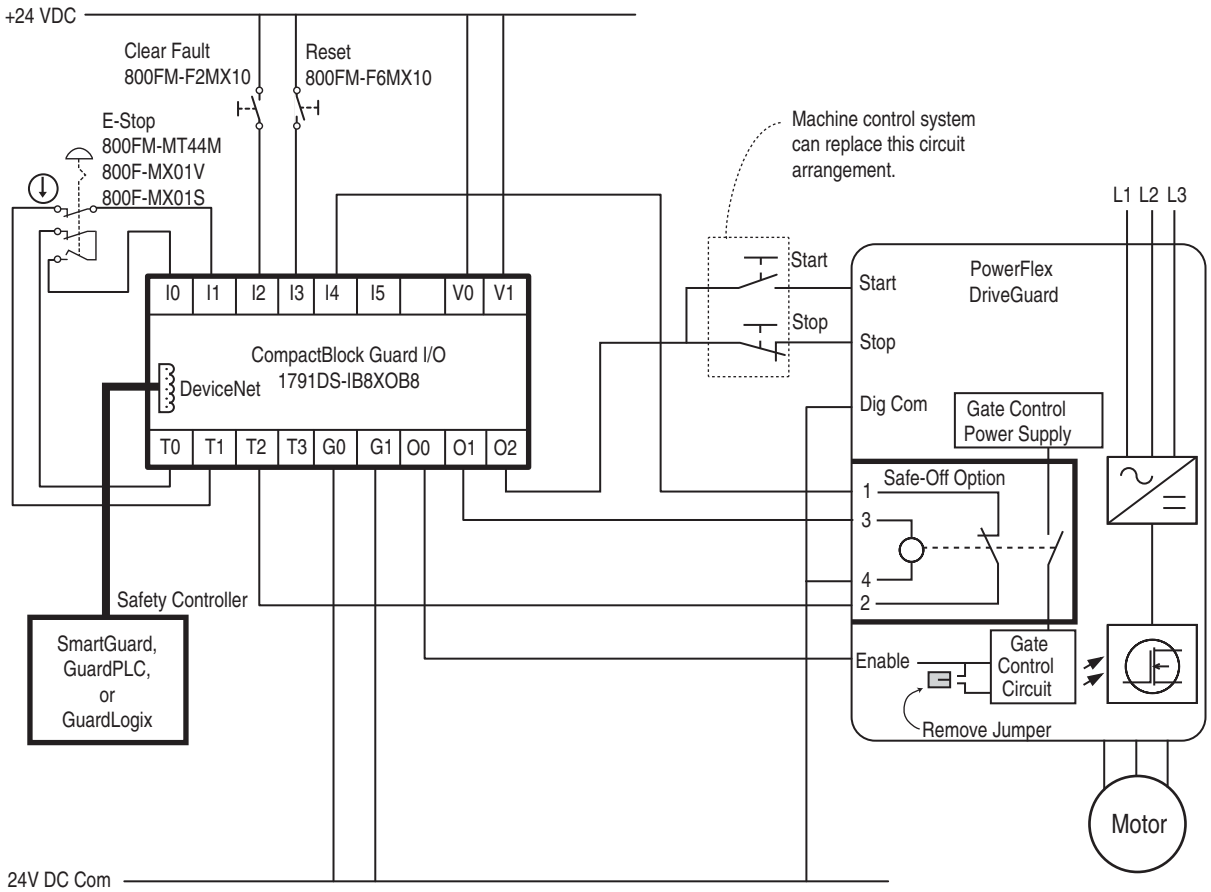
Upon power-up, the MSR127TP performs internal checks. The MSR127TP then looks for dual signals from the Trojan5-GD2. If only one signal is present, or a crossfault exists, the MSR127TP assumes a fault is present and does not energize its safety outputs. With the gate closed, the MSR127TP checks the S12/S34 monitoring circuit. If the Safe-Off options are de-energized, the MSR127TP assumes the drives are off and are ready to be enabled. The MSR127TP energizes its safety outputs. If the monitoring circuit remains open, the MSR127TP will assume a fault is present and not allow its safety outputs to energize. Single point failures related to the tongue interlock are excluded if actuator speed, alignment and mechanical stops meet installation instruction requirements, and a periodic proof test confirms proper operation.

Ratings

The safety function intiated by the Trojan 5-GD2 gate interlocks meets the safety performance requirements of SIL CL 2 per IEC 62061:2005 and has a Category 3 structure that can be used in systems requiring Performance Levels up to PLd per ISO 13849-1:2006. This circuit executes a Category 0 stop.

Drive & Safety I/O—Integrated Architecture

800F, CompactBlock Guard I/O, PowerFlex DriveGuard



Circuit Status

The e-stop is reset. The outputs of the CompactBlock Guard I/O are off. The PowerFlex output is off. The motor is off.

Operating Principle

STARTING: Press and release the reset button to energize the outputs of the 1791DS. This action energizes the Safe-Off option which connects the Gate Control Power Supply to the Gate Control Circuit. It also provides the Enable signal which allows the Gate Control Circuit to turn the output drive transistor on and off. Output O2 applies power to the Start and Stop controls, which can then be used to control the drive for production operations.

STOPPING: When the e-stop is pressed, the O2 output sends a stop command to the drive, which executes its pre-programmed stopping routine. After a short delay (programmed in the safety controller), the O0 and O1 outputs turn off. This disables the drive. The normally closed contact in the Safe-Off option closes and sends a signal back to terminal I4 to inform the safety system that the drive is ready for restart.

Fault Detection

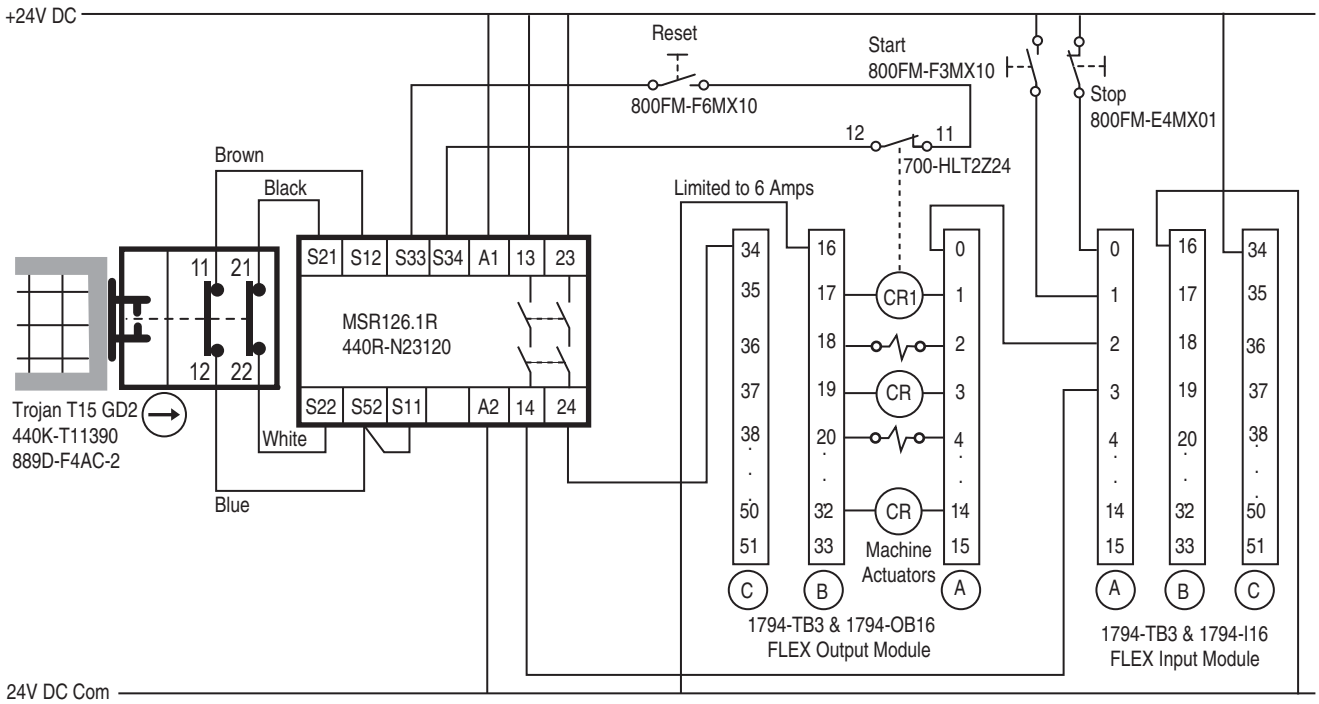
Upon power-up, the PowerFlex drive and 1791DS perform internal checks. The 1791DS then looks for dual signals from the e-stop. The pulsed outputs T0 and T1 are used to help check for open and short circuit fault conditions in the e-stop circuit. The e-stop has a self-monitoring contact, which opens if the contact block falls off the control panel. With the e-stop signals made, the 1791DS checks the monitoring circuit (terminal I4) when the reset button is pressed. If these checks are OK, the outputs energize. If the O2 output of the 1791DS faults to the ON state, the motor is stopped by the O0 and O1 outputs, and the fault will be detected on the next attempt to re-start by the self-checking in the 1791DS. If the drive control faults to an ON state, the motor will stop because the power to the drive control circuit will be removed by the Safe-Off option.

Ratings

The safety function intiated by the 800F e-stop meets the safety performance requirements of SIL CL 2 per IEC 62061:2005 and has a Category 3 structure that can be used in systems requiring Performance Levels up to PLd per ISO 13849-1:2006. This circuit executes a Category 1 stop, by the program in the safety controller.

Interlock Switch Gater with High Current Outputs

Trojan T15 GD2, 800F, MSR126, Flex I/O



Circuit Status

The safety gate is closed. The outputs of the MSR126.1R safety relay are open and the machine actuators are off. Control Relay CR1 is de-energized and its 11/12 contact is closed.

Operating Principle

The MSR126.1R is chosen for this application because its thermal (non-switching) current carrying capacity is 6 A in one circuit. The Flex output module performs the normal switching of the machine actuators during the manufacturing process. The safety system enables the machine functions by providing power to the FLEX Output Module. One of the Flex outputs must drive an electro-mechanical output whose normally closed contact is in the monitoring loop of the safety relay. The machine logic must energize this output while the machine is running, as it is used by the MSR126.1R to confirm that power is removed from the output module, before restarting.

STARTING: Press the reset button to energize the output contacts 13/14 of the MSR126.1R. This connects the 24V supply to terminal C34 of Flex 1974-OB16 output module and also sends a signal to the A3 terminal of the 1794-IB16. The logic system is informed that the gate is closed and the machine is ready to run. Press the Start button to start the machine process.
STOPPING: Press the Stop button to stop the machine. Then, open the gate to access the machine. While the gate is open, the machine actuators cannot operate because power is removed from the output module. If the gate is inadvertently opened while the machine is running, power will be removed from output module and the machine actuators will be de-energized.

Fault Detection

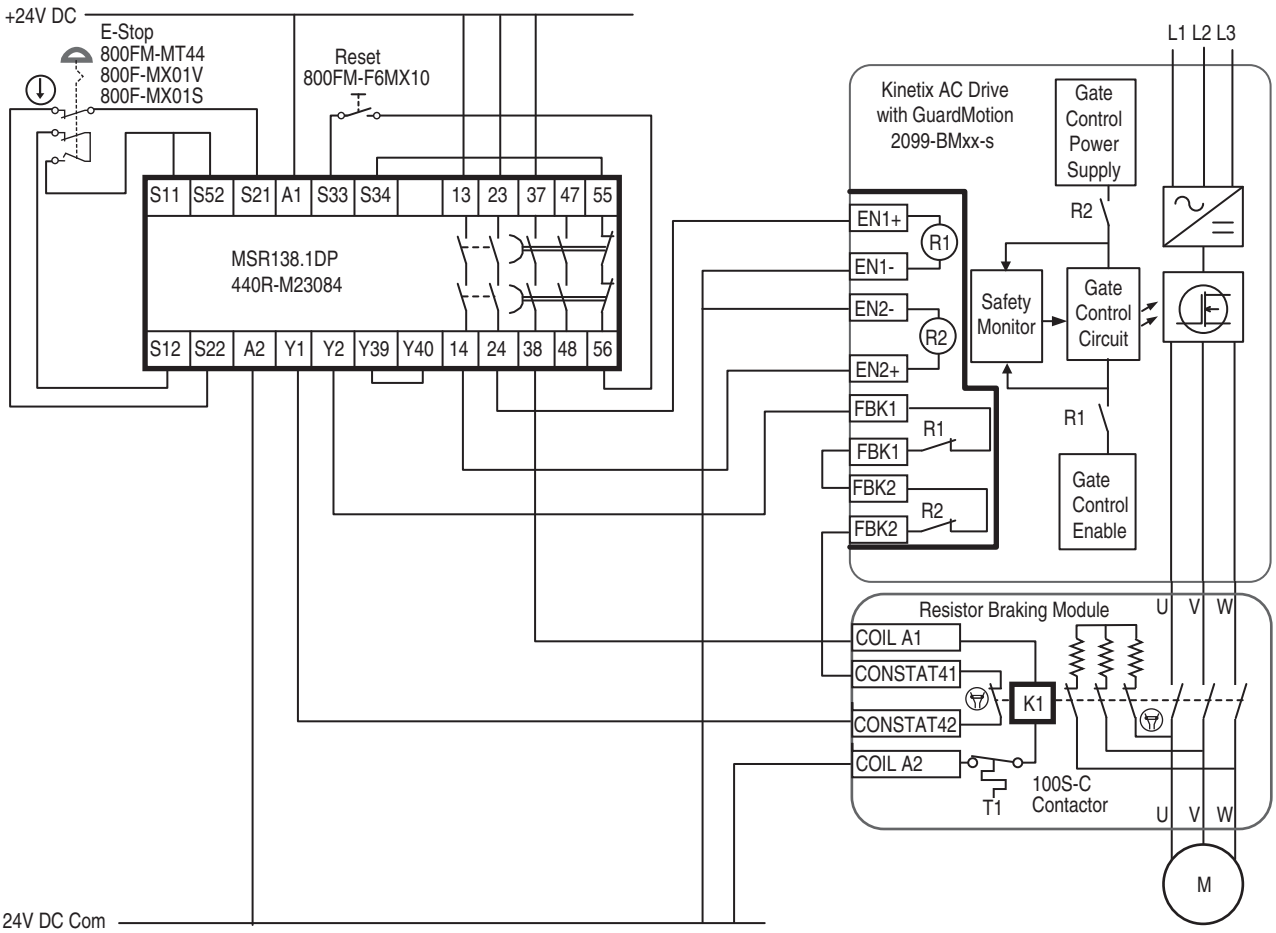
Upon successful completion internal checks on power up, the MSR126.1R checks the input circuits. With the gates closed, the MSR126.1R checks the dual circuits and then waits for the reset signal. A single fault, a short from 24V to terminal 14 of the MSR126.1R, may lead to the loss of the safety function. With the MSR126.1R and Flex system mounted in the same cabinet and with proper validation, this fault may be excluded. If not mounted in the same cabinet, a signal from the output (A0) should be fed back into the input module (A2). The logic can perform a comparison of input A2 and A3, and turn the machine off if these signals are not in agreement. If CR1 is not de-energized when the gate is closed, the MSR126.1R will not close its outputs.

Ratings

The safety function intiated by the Trojan T15-GD2 gate interlocks meets the safety performance requirements of SIL CL 2 per IEC 62061:2005 and has a Category 3 structure that can be used in systems requiring Performance Levels up to PLd per ISO 13849-1:2006. This circuit executes a Category 0 stop.

Safety Motion—Delayed Braking

800F, MSR138, Kinetix GuardMotion, RBM



Circuit Status

The e-stop is reset. The outputs of the safety relay are open, and the motor is off.

Operating Principle

STARTING: Press and release the reset button to energize the outputs of the MSR138. This action energizes the 100S contactor in the resistor braking module, which connects the motor to the drive and enables the operation of the Kinetix drive. When the Kinetix drive is enabled, an internal signal is sent back to its controller (not shown) to inform it that the drive is enabled. The motor is then controlled by its controller.

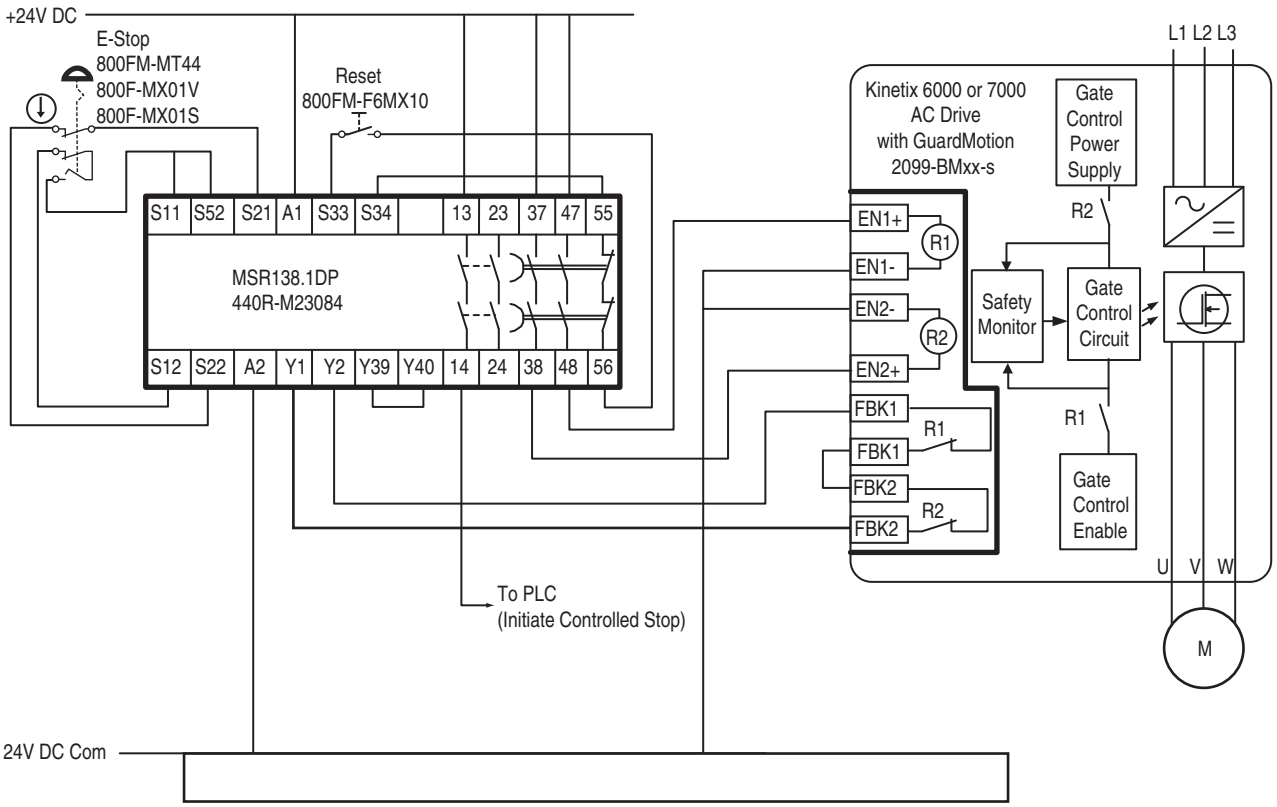
STOPPING: When the e-stop is pressed, the immediate outputs of the MSR138 open and disable the drive. The motor begins to coast to a stop. After the time delay of the MSR138 expires, the delayed outputs open and drop out the 100S contactor in the Resistor Braking Module. This disconnects the motor from the drive and engages the braking resistors, which rapidly stop the motor.

Fault Detection

Upon power-up, the Kinetix drive and MSR138 perform internal checks. The MSR138 then looks for dual signals from the e-stop. The e-stop has a self-monitoring contact, which opens if the contact block falls off the control panel. With the e-stop signals made, the MSR138 checks the Y1/Y2 monitoring circuit when the reset button is pressed. If these checks are OK, the output energizes. If the delayed outputs of the MSR138 fault to the ON state, the motor is stopped by the MSR138 immediate outputs. The fault will be detected by the Y1/Y2 monitoring circuit on the next attempt to re-start because K1 will remain energized. If the drive faults to an ON state, the motor will stop because it will be disconnected by K1. This fault will be detected by the Y1/Y2 monitoring circuit on the next attempt to re-start because the Kinetix feedback circuit will remain off. If K1 gets stuck or welded closed, the motor will stop by the drive and the fault will be detected by the Y1/Y2 monitoring circuit of the MSR138 on the next attempt to re-start.

Ratings

The safety function intiated by the 800F e-stop meets the safety performance requirements of SIL CL 2 per IEC 62061:2005 and has a Category 3 structure that can be used in systems requiring Performance Levels up to PLd per ISO 13849-1:2006. This circuit executes a Category 1 stop.



Circuit Status

The e-stop is reset. The outputs of the safety relay are open, and the motor is off.

Operating Principle

STARTING: Press and release the reset button to energize the outputs of the MSR138. This action enables the operation of the Kinetix drive. When the Kinetix drive is enabled, an internal signal is sent back to its controller (not shown) to inform it that the drive is enabled. The motor is then controlled by its controller.
STOPPING: When the e-stop is pressed, the immediate outputs of the MSR138 open and sends a signal the to the machine control PLC to initiate a controlled stop. After the time delay of the MSR138 expires, the delayed outputs open and drop out the GuardMotion feature which disables the drive.

Fault Detection

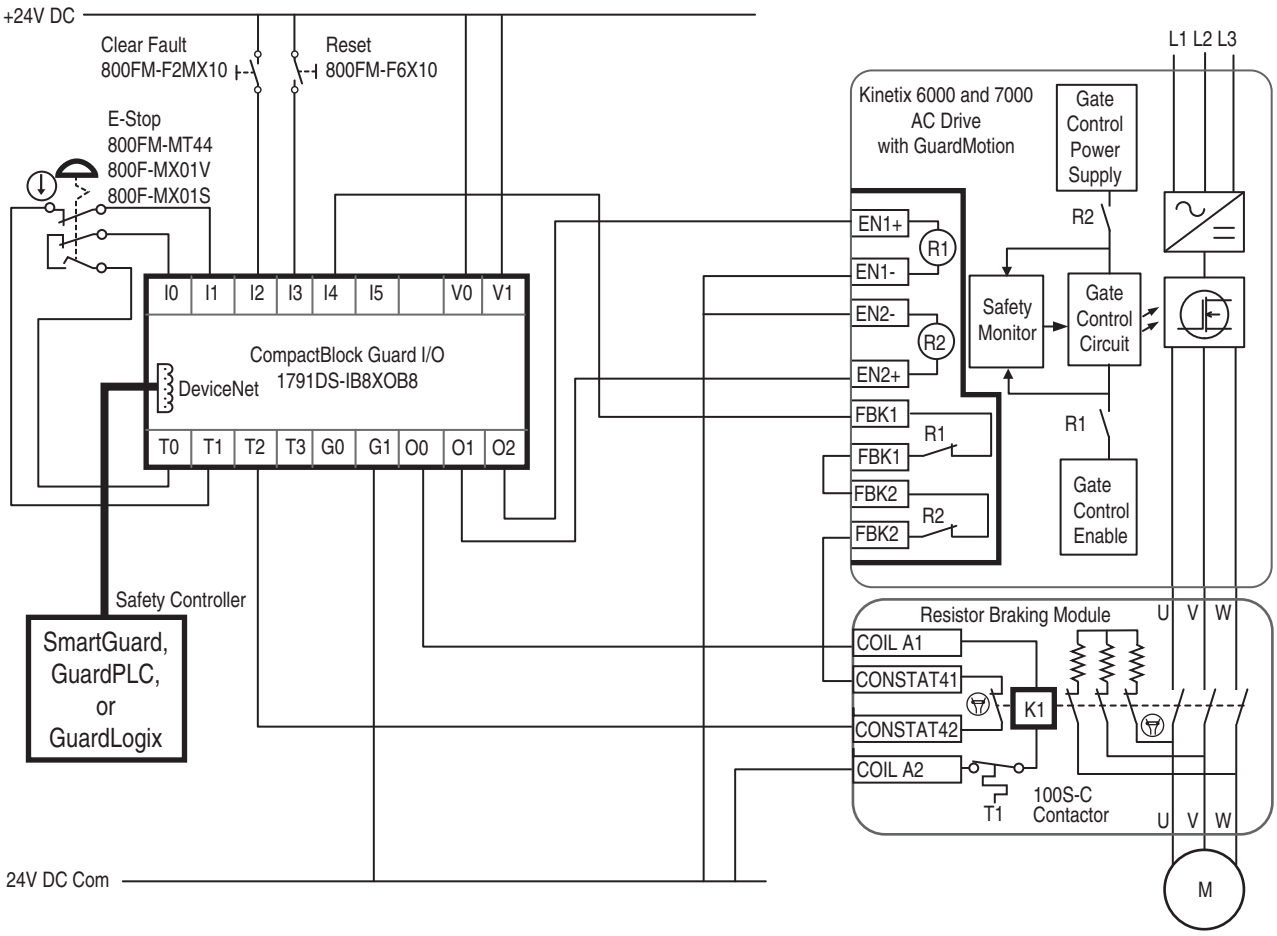
Upon power-up, the Kinetix drive and MSR138 perform internal checks. The MSR138 then looks for dual signals from the e-stop. The e-stop has a self-monitoring contact, which opens if the contact block falls off the control panel. With the e-stop signals made, the MSR138 checks the Y1/Y2 monitoring circuit when the reset button is pressed. If these checks are OK, the output energizes. If the delayed outputs of the MSR138 fault to the ON state, the motor is stopped by the MSR138 immediate outputs. The fault will be detected by the S33/S34 monitoring circuit on the next attempt to re-start. If one of the safe-off relays faults to the ON state, the MSR138 will detect the fault in the Y1/Y2 circuit on the next attempt to start the drive.

Ratings

The safety function intiated by the 800F e-stop meets the safety performance requirements of SIL CL 2 per IEC 62061:2005 and has a Category 3 structure that can be used in systems requiring Performance Levels up to PLd per ISO 13849-1:2006. This circuit executes a Category 1 stop.

Safety Motion & Safety I/O—Integrated Architecture

800F, CompactBlock Guard I/O, Kinetix GuardMotion, RBM



Circuit Status

The e-stop is reset. The outputs of the CompactBlock Guard I/O are off. The Kinetix outputs are off. The Resistor Braking Module is off. The motor is off.

Operating Principle

STARTING: Press and release the reset button to energize the outputs of the CompactBlock Guard I/O. This action energizes the 100S contactor in the resistor braking module, which connects the motor to the drive and enables the operation of the Kinetix drive. When the Kinetix drive is enabled, an internal signal is sent back to its controller (not shown) to inform it that the drive is enabled. The motor is then controlled by its controller.

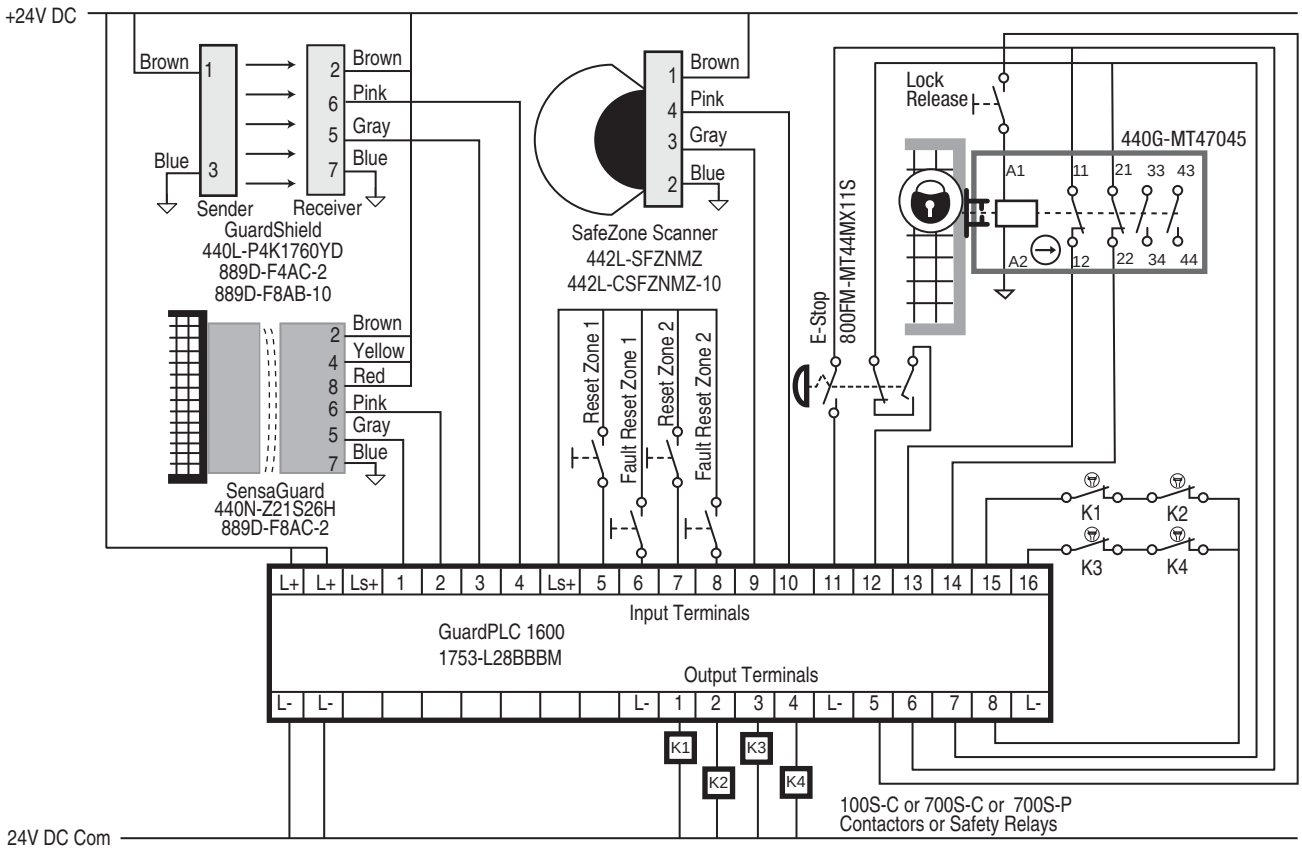
STOPPING: When the e-stop is pressed, the O1 and O2 outputs of the 1791DS open and disable the drive. The motor begins to coast to a stop. After a short delay (determined by a risk assessment or stop time measurement and programmed in the safety controller), the O0 output turns off and drops out the 100S contactor in the resistor braking module. This disconnects the motor from the drive and engages the braking resistors, which rapidly stop the motor.

Fault Detection

Upon power-up, the Kinetix drive and 1791DS perform internal checks. The 1791DS then looks for dual signals from the e-stop. The pulsed outputs T0 and T1 are used to help check for open and short circuit fault conditions in the e-stop circuit. The e-stop has a self-monitoring contact, which opens if the contact block falls off the control panel. With the e-stop signals made, the 1791DS checks the monitoring circuit when the reset button is pressed. If these checks are OK, the outputs energize. If the O0 output of the 1791DS faults to the ON state, the motor is stopped by the O1 and O2 outputs. The fault will be detected by the safety controller on the next attempt to re-start because K1 will remain energized. If the drive faults to an ON state, the motor will still be able to stop because it will be disconnected by K1. This fault will be detected on the next attempt to re-start because the Kinetix feedback circuit will remain off. If K1 gets stuck or welded closed, it will still be possible to stop the motor by the drive, and the fault will be detected by the safety controller on the next attempt to re-start.

Ratings

The safety function intiated by the 800F e-stop meets the safety performance requirements of SIL CL 3 per IEC 62061:2005 and has a Category 4 structure that can be used in systems requiring Performance Levels up to PLe per ISO 13849-1:2006. This circuit executes a Category 0 stop. To achieve a Category 1 stop, the machine control system must be notified of the e-stop command through DeviceNet, command the Kinetix to execute a stop, and delay the outputs O0, O1, and O2 until the stop condition is completed.



Circuit Status

The GuardPLC is programmed to control two zones without a DIO connection. The GuardShield and SensaGuard are associated with Zone 1 and contactors K1 and K2. The SafeZone Laser Scanner and 440G-MT are associated with Zone 2 and contactors K3 and K4. The SafeZone, located behind the locked safety gate, is used to detect someone in the hazard area. The E-Stop applies to both zones. The two safety gates are closed, the light curtain and zone scanner are clear and the e-stop is released. Both zones are ready to be activated.

Operating Principle

STARTING: Press the reset button for each zone to energize the safety outputs of the GuardPLC. The safety contactors K1 through K4 become energized and allow the zones to operate. The GuardPLC signals the machine control system over an Ethernet/IP connection that the zones are ready to run. The machine control system (not shown) controls the zones.

STOPPING: Obstructing the light curtain or opening the SensaGuard gate will de-energize the K1 and K2 contactors. Clearing the light curtain or closing the gate will not cause the contactors to re-energize. The Zone 1 Reset button must be pressed to restart Zone 1. The e-stop acts as a global stop. When pressed, both zones are de-energized. The GuardPLC energizes Output 5 to provide voltage for the 440G-MT guard locking solenoid. Pressing the Gate Release button allows the gate to be opened. Closing the gate or resetting the e-stop does not re-energize the K1-K4 contactors. The respective Zone Reset buttons must be pressed after the input devices are cleared.

Fault Detection

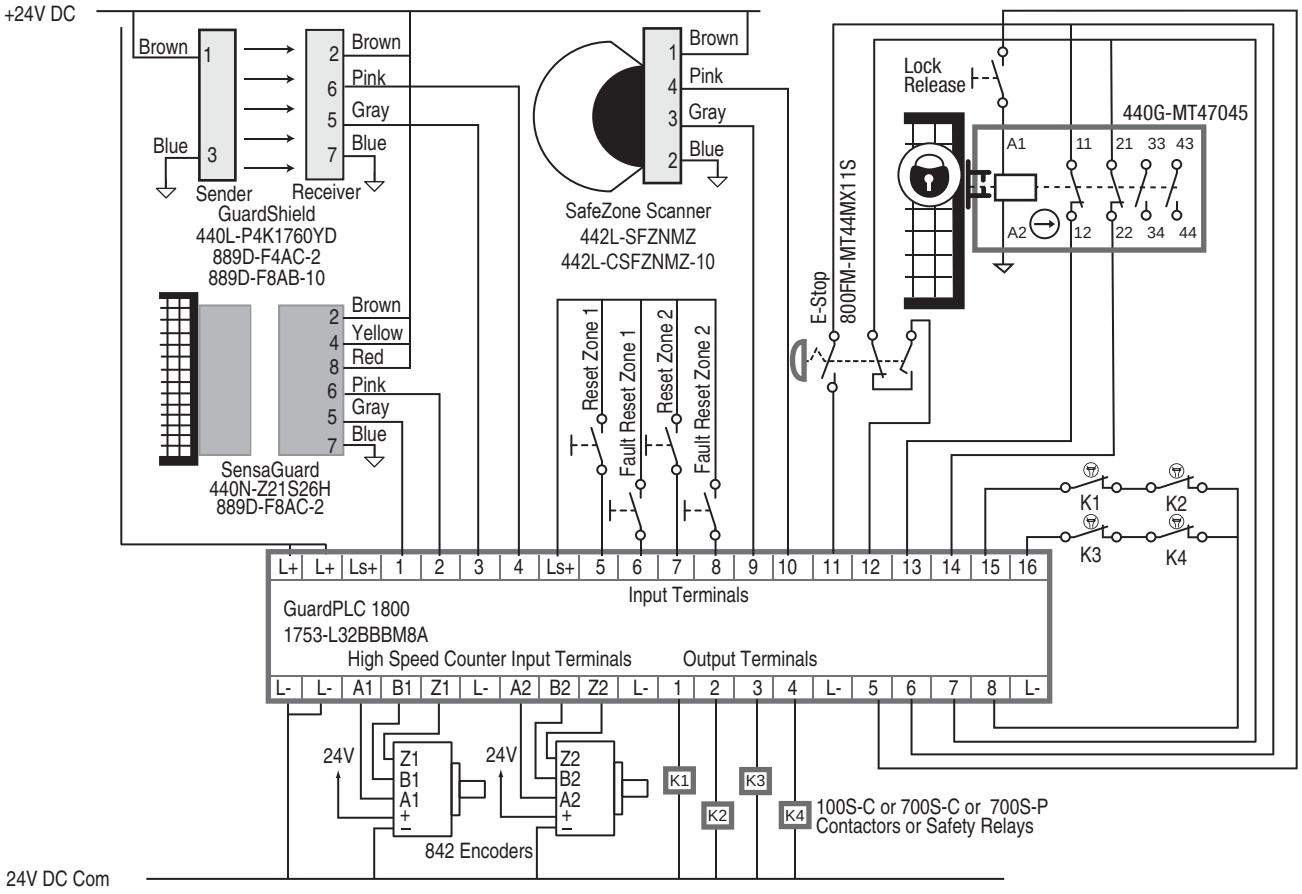
Upon successful completion of internal checks on power up, the GuardPLC checks the input devices. Outputs 6 and 7 are configured as pulse test sources and are used by the GuardPLC to help check for open and short-circuit fault conditions of the E-Stop and 440G-MT interlock. If a fault is detected, the GuardPLC will not energize the respective outputs. The GuardPLC checks the status of the K1-K4 contactors. If the contactors are energized, stuck or welded closed, the GuardPLC will detect this due to the open circuit to Inputs 15 or 16, and will not energize the respective zone. Output 8 is configured as a pulse test source to help detect wiring faults on these contactor feedback circuits. The programmable safety function blocks associated with each device performs self checking. If a fault occurs, the respective Fault Reset button must be pressed, after the fault is cleared. Then, the Reset button must be pressed and released for the machine to restart.

Ratings

The ratings assume that two contactors are connected in series to power the hazards. The safety function intiated by the SensaGuard interlock, GuardShield light curtains, and 800F e-stop meet the safety performance requirements of SIL CL 3 per IEC 62061:2005 and has a Category 4 structure that can be used in systems requiring Performance Levels up to PLe per ISO 13849-1:2006. The safety functions initiated by the SafeZone scanner and 440G-MT interlock meet the safety performance requirements of SIL CL 2 per IEC 62061:2005 and have a Category 3 structure that can be used in systems requiring Performance Levels up to PLd per ISO 13849-1:2006. This circuit executes a Category 0 stop.

Safety PLC—Two Zones with Encoders

GuardShield, SensaGuard, SafeZone, 800F, 440G-MT, 842 Encoders, GuardPLC 1800, 100S, 700S



Circuit Status

The GuardPLC is programmed to control two zones. The GuardShield and SensaGuard control Zone 1 with contactors K1 and K2. The SafeZone Laser Scanner and 440G-MT control Zone 2 with contactors K3 and K4. The SafeZone, located behind the locked safety gate, is used to detect someone in the hazard area. The E-Stop applies to both zones. The dual encoders monitor the machine for zero speed and safe speed. The safety gates are closed; the light curtain and zone scanner are clear; the machine is at zero speed; and the e-stop is released. Both zones are ready to be activated.

Operating Principle

STARTING: Press the reset button for each zone to energize the safety outputs of the GuardPLC. The safety contactors K1 through K4 become energized and allow the zones to operate. The GuardPLC signals the machine control system over an Ethernet/IP connection that the zones are ready to run. The machine control system (not shown) controls the zones.

STOPPING: Obstructing the light curtain or opening the SensaGuard gate will de-energize the K1 and K2 contactors. Clearing the light curtain or closing the gate will not cause the contactors to re-energize. The Zone 1 Reset button must be pressed to restart Zone 1. The e-stop acts as a global stop. When pressed, both zones are de-energized. The GuardPLC energizes Output 5 to provide voltage for the 440G-MT guard locking solenoid. Pressing the Lock Release button allows the gate to be opened. Closing the gate or resetting the e-stop does not re-energize the K1-K4 contactors. The respective Zone Reset buttons must be pressed after the input devices are cleared.

Fault Detection

Upon successful completion of internal checks on power up, the GuardPLC checks the input devices. Outputs 6 and 7 are configured as pulse test sources and are used by the GuardPLC to help check for open and short-circuit fault conditions of the E-Stop and 440G-MT interlock. If a fault is detected, the GuardPLC will not energize the respective outputs. The GuardPLC checks the status of the K1-K4 contactors. If the contactors are energized, stuck or welded closed, the GuardPLC will detect this due to the open circuit to Inputs 15 or 16, and will not energize the respective zone. Output 8 is configured as a pulse test source to help detect wiring faults on these contactor feedback circuits. The programmable safety function blocks associated with each device performs self checking. If a fault occurs, the respective Fault Reset button must be pressed, after the fault is cleared.

Ratings

The ratings assume that two contactors are connected in series to power the hazards. The safety function intiated by the SensaGuard interlock, GuardShield light curtains, and 800F e-stop meet the safety performance requirements of SIL CL 3 per IEC 62061:2005 and has a Category 4 structure that can be used in systems requiring Performance Levels up to PLe per ISO 13849-1:2006. The safety functions initiated by the SafeZone scanner and 440G-MT interlock meet the safety performance requirements of SIL CL 2 per IEC 62061:2005 and have a Category 3 structure that can be used in systems requiring Performance Levels up to PLd per ISO 13849-1:2006. This circuit executes a Category 0 stop.

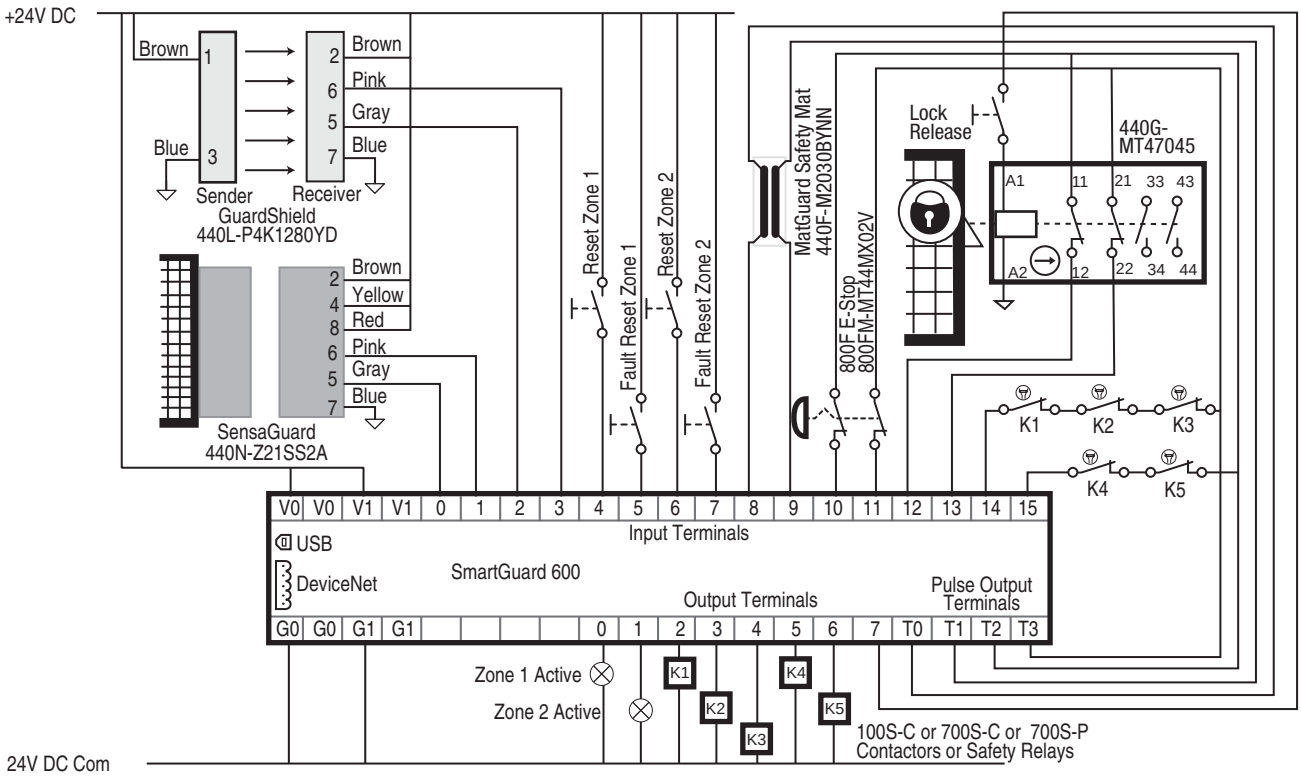
Allen-Bradley
GuardMaster®

Safety PLC—Two Zones

GuardShield, SensaGuard, MatGuard, 800F, 440G-MT, SmartGuard 600, 100S, 700S



Circuit Status

The SmartGuard is programmed to control two zones without a DeviceNet connection. The GuardShield and SensaGuard control zone 1 with contactors K1, K2 and K3. The MatGuard and the 440G-MT control zone 2 with contactors K4 and K5. The MatGuard, located behind the locked safety gate, is used to detect someone in the hazard area. The e-stop applies to both zones. The two safety gates are closed, the light curtain and safety mat are clear and the e-stop is released. Both zones are ready to be activated.

Safety Mat Principles

Outputs T0 and T1 are configured as standard diverse outputs to source the 24V for the safety mat circuits. When a demand is placed on the mat, the circuits short together and both inputs (IN8 and IN9) are HI. Software detects the non-diversity and de-energizes zone 2. In this application, stepping on the mat cannot be differentiated from an actual channel to channel short between the mat circuits. Due to this, stepping on the mat must stop the hazard, and a manual reset is required to restart after each demand on the mat.

Operating Principle

STARTING: Press the reset button for each zone to energize the safety outputs of the SmartGuard. Two indicators are illuminated to show the zones are active. The safety contactors K1 through K5 become energized and allow the zones to operate. Spare contacts (not shown) on the K1-K5 devices signal the machine control system that the zones are ready to run. The machine control system (not shown) controls the zones.

STOPPING: Obstructing the light curtain or opening the SensaGuard gate will de-energize the K1-K3 contactors. Clearing the light curtain or closing the gate will not cause the contactors to energize. The zone 1 Reset button must be pressed to restart zone 1. The e-stop acts as a global stop. When pressed, both zones are de-energized. The guard locking gate is associated with the e-stop. After pressing the e-stop, the SmartGuard energizes output 7 which provides voltage for the guard locking solenoid. Press the Lock Release push button to power the solenoid and open the gate. Closing the gate or resetting the e-stop does not re-energize the K1-K5 contactors. The respective zone reset buttons must be pressed after the input devices are cleared.

Fault Detection

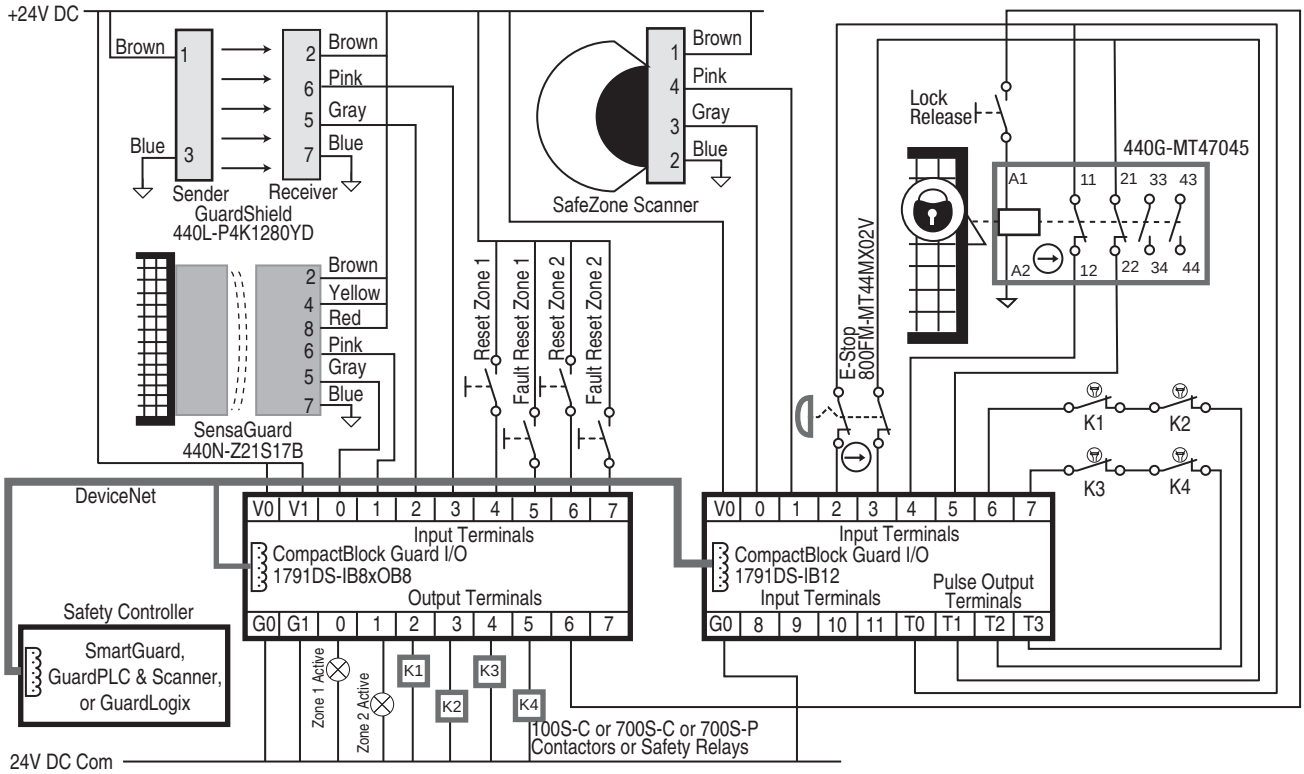
Upon successful completion of internal checks on power up, the SmartGuard checks the input devices. The pulsed outputs T2-T3 are used by the SmartGuard to help check for open and short-circuit fault conditions. If a fault is detected, the SmartGuard will not energize the respective outputs. When the zone reset buttons are pressed, the SmartGuard checks the status of the K1-K5 contactors. If the contactors are energized, stuck or welded closed, the SmartGuard will detect this due to the open circuit to Inputs 14 or 15, and will not energize the respective zone. The programmable safety function blocks associated with each device performs self-checking. If a fault occurs, the respective fault reset button must be pressed, after the fault is cleared.

Ratings

The ratings assume that two contactors are connected in series to power the hazards. The safety function intiated by the SensaGuard interlock, GuardShield light curtains, and 800F e-stop meet the safety performance requirements of SIL CL 3 per IEC 62061:2005 and has a Category 4 structure that can be used in systems requiring Performance Levels up to PLe per ISO 13849-1:2006. The safety functions initiated by the MatGuard safety mat and 440G-MT interlock meet the safety performance requirements of SIL CL 2 per IEC 62061:2005 and have a Category 3 structure that can be used in systems requiring Performance Levels up to PLd per ISO 13849-1:2006. This circuit executes a Category 0 stop. If only one contactor is used to power a hazard, the safety function can meet SIL CL 2, Category 2 structure and PLd.

Safety I/O—Two Zones Distributed

GuardShield, SensaGuard, SafeZone, 800F, 440G-MT, CompactBlock Guard I/O, 100S, 700S



Safety Control System

Compact Block Guard I/O resides on a DeviceNet safety network and operates as a safety slave. Safety Masters that can 'own' the Compact Block Guard I/O modules include GuardLogix, SmartGuard, and the GuardPLC safety controllers. Note the GuardPLC requires a 1753-DNSI Safety Scanner to 'own' Compact Block Safety I/O. For the remainder of this application note, the Safety Master will be referred to as the 'safety controller.' Since the various Safety Controllers have varied communication interfaces to the standard machine control system, this application note will make no references to this link.

Circuit Status

The safety controller is programmed to control two zones. The GuardShield and SensaGuard control zone 1 with contactors K1 and K2. The SafeZone Laser Scanner and 440G-MT control zone 2 with contactors K3 and K4. The SafeZone, located behind the locked safety gate, is used to detect someone in the hazard area. The E-Stop applies to both zones. The two safety gates are closed, the light curtain and laser scanner are cleared and the e-stop is released. Both zones are ready to be activated.

Operating Principle

STARTING: Press the reset button for each zone to allow the safety controller to energize the safety outputs of the CompactBlock Guard I/O. The safety contactors K1 through K4 become energized and allow the zones to operate. The safety controller signals the machine control system that the zones are ready to run. The machine control system (not shown) controls the zones.

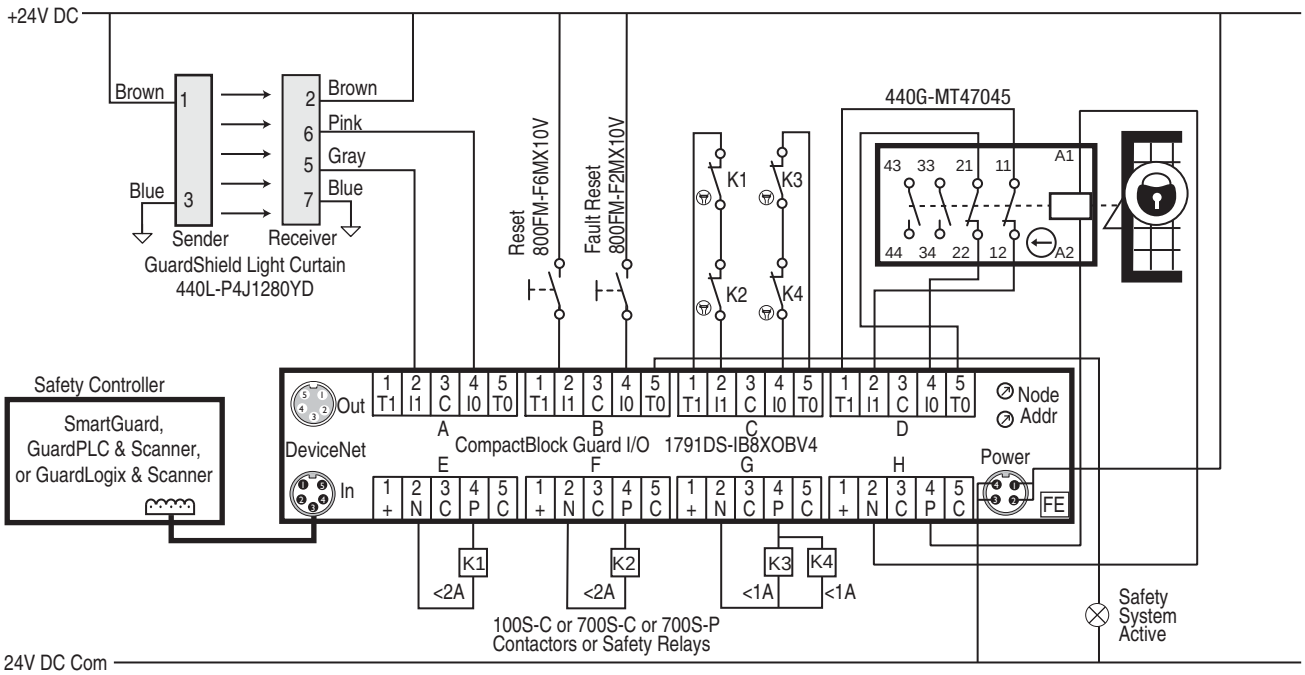
STOPPING: Obstructing the light curtain or opening the SensaGuard gate will de-energize the K1 and K2 contactors. Clearing the light curtain or closing the gate will not cause the contactors to energize the zone 1 Reset button must be pressed to restart zone 1. The e-stop acts as a global stop. When pressed, both zones are de-energized. The safety controller energizes Output 6 to provide voltage for the 440G-MT guard locking solenoid. Press the Lock Release button and open the gate. Closing the gate or resetting the e-stop does not re-energize the K1-K4 contactors. The zone reset buttons must be pressed after clearing the input devices.

Fault Detection

Upon successful completion of internal checks on power up, the CompactBlock Guard I/O checks the input devices. Test outputs T2 and T1 are configured as pulse test sources and are used by the CompactBlock Guard I/O to help check for open and short-circuit fault conditions of the E-Stop and Gateswitch. If a fault is detected, the safety controller will not energize or will de-energize the respective outputs. The safety controller checks the status of the K1-K4 contactors. If the contactors are energized, stuck or welded closed, the safety controller will detect this due to the open circuit to Inputs 6 or 7 on the IB12, and will not energize the respective zone. Test outputs T2 and T3 are used to help detect wiring faults on these contactor feedback circuits. The programmable safety function blocks associated with each device performs self checking. If a fault occurs, the respective Fault Reset button must be pressed, after the fault is cleared.

Ratings

The ratings assume that two contactors are connected in series to power the hazards. The safety function intiated by the SensaGuard interlock, GuardShield light curtains, and 800F e-stop meet the safety performance requirements of SIL CL 3 per IEC 62061:2005 and has a Category 4 structure that can be used in systems requiring Performance Levels up to PLe per ISO 13849-1:2006. The safety functions initiated by the SafeZone scanner and 440G-MT interlock meet the safety performance requirements of SIL CL 2 per IEC 62061:2005 and have a Category 3 structure that can be used in systems requiring Performance Levels up to PLd per ISO 13849-1:2006. This circuit executes a Category 0 stop.



Circuit Status

The light curtain is cleared, and the 440G-MT guard locking switch is closed and locked. The contactors K1-K4 are off. The safety system is ready to be energized.

Operating Principle

The 1791DS-IB8X0BV4 has bi-polar outputs, which allows the module to switch both the positive and negative side of the load device (e.g. contactors and solenoids) and to check for faults on both the positive and negative side of the load.
STARTING: Press the reset button to energize the contactors K1-K4. The safety controller verifies that the monitoring circuits at terminals in the "C" connector are closed. The safety contactors K1 through K4 become energized and allow the machine to run. The Safety System Active indicator is turned on by the safety controller. The safety controller signals the machine control system that the safety system is ready to run. The machine control system (not shown) controls the machine.
STOPPING: Obstructing the light curtain de-energizes contactors K1-K4. The contactors may also be de-energized by the safety controller due to other safety demands (like a system level e-stop). When the contactors K1-K4 are de-energized, the solenoid of the 440G-MT can be energized and allow the gate to be opened. While the gate is open, the program in the safety controller must not allow the contactors to re-energize. Closing the gate or clearing the light curtain do not re-energize the contactors. Press the reset button to re-energize the contactors.

Fault Detection

Upon successful completion of internal checks on power up, the safety controller checks the input devices. Test outputs T0 and T1 in the "D" connector are configured as pulse test sources and are used by the safety controller to help check for open and short-circuit fault conditions of the 440G-MT gateswitch. If a fault is detected, the safety controller will not energize the K1-K4 contactors. The safety controller checks the status of the K1-K4 contactors. The safety controller will detect contactors that are energized, stuck or welded closed by the open circuits at inputs I0 and I1 and will not energize the respective zone. The contactors and the 440G-MT solenoid are switched on both the positive and negative side, so shorts to either the supply voltage or to ground will be detected. After clearing a fault, press the Fault Reset button to reset the module. Press the Reset button to allow the contactors to be energized.

Programming

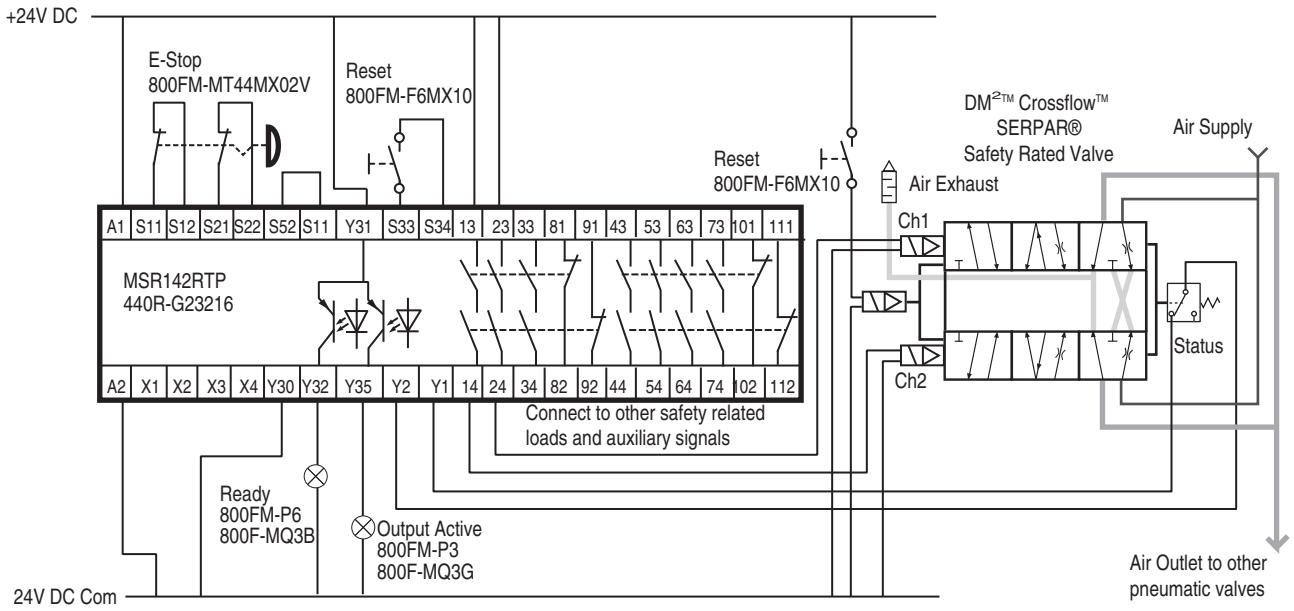
The safety outputs of the 1791DS-IB8XOBV4 are configured in firmware as four (4) dual channel pairs. Both outputs in the pair must be complementary or a fault occurs. Outputs TO and T` in the "D" connector must be configured as pulse outputs. Test outputs T0 in the "B" connector must be configured in software as 'standard outputs' to drive the Safety System Active indicators.

Ratings

The ratings assume that two contactors are connected in series to power the hazards. The safety function intiated by the GuardShield light curtain meets the safety performance requirements of SIL CL 3 per IEC 62061:2005 and has a Category 4 structure that can be used in systems requiring Performance Levels up to PLe per ISO 13849-1:2006. The safety functions initiated by the 440G-MT interlock meet the safety performance requirements of SIL CL 2 per IEC 62061:2005 and have a Category 3 structure that can be used in systems requiring Performance Levels up to PLd per ISO 13849-1:2006. This circuit executes a Category 0 stop. If only one contactor is used to power a hazard, the safety function can meet SIL CL 2, Category 2 structure and PLd.

Safety Valve & E-Stop—Air Supply Release

800F, MSR142, Pneumatic Safety Valve



Circuit Status

The e-stop button is released, the MSR142 safety relay outputs are off and the pneumatic valve is closed.

Operating Principle

STARTING: Press the reset button to energize the output contacts of the safety relay. The two solenoids in the valve energize and allow air to flow from the Air Supply to the Air Outlet.

STOPPING: Pressing the e-stop button de-energizes the safety outputs of the MSR142, which in turn drops out the solenoids of the safety valve. The valve closes the Air Supply and releases the air pressure to the Air Exhaust. Releasing the e-stop button does not cause the valve to turn back on.

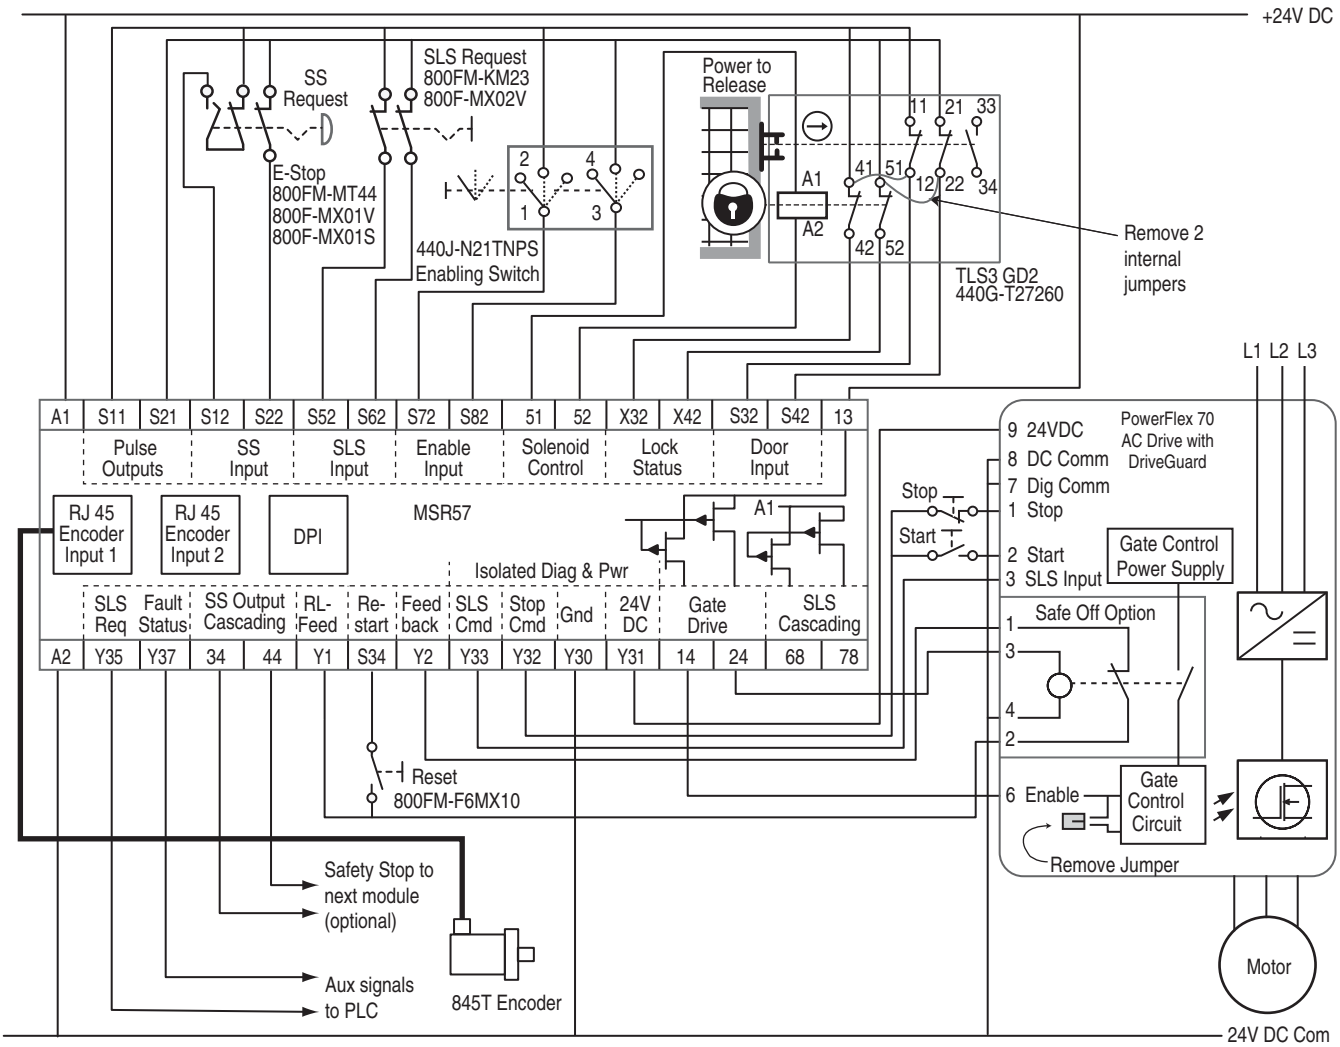
Fault Detection

Upon successful completion of internal checks on power up, the MSR142 checks the e-stop status. If an open or short circuit is detected, the MSR142 will not energize its outputs. If both input circuits are properly closed, the MSR142 checks the status of the safety valve. If one or both solenoids of the safety valve are energized, the Status contact will be open, and the MSR142 will not energize its outputs. If both solenoids are de-energized, Status contact will be closed and the MSR142 will turn on its Ready LED. Pressing the Reset button energizes the MSR142 safety outputs and opens the safety valve.

The safety valve performs its own internal checks. If one of the valves remains actuated, gets stuck or moves too slowly, the Air Outlet flow will be re-directed to the exhaust. To clear the fault condition, both valves must be de-energized and the valve reset button pressed.

Ratings

The safety function initiated by the 800F e-stop button meets the safety performance requirements of SIL CL 3 per IEC 62061:2005 and has Category 4 structure that can be used in systems requiring Performance Levels up to PLe per ISO 13849-1: 2006. The MSR142 has seven safety rated outputs. To maintain the highest safety levels, these outputs must drive redundant actuators which must be monitored for proper performance. This example circuit performs a Stop Category 0 function (coast to stop).



Circuit Status

The safe stop (SS) request e-stop button is released. The safe limited speed (SLS) request button is released. The enabling switch is released. The guard locking interlock is closed and locked. The safety outputs (Gate Drive) of the MSR57 are off. The motor is off.

Operating Principle

The MSR57 performs the safe limited speed function. It provides a signal to the drive to initiate the slow speed. The MSR57 accepts encoder signals to monitor the speed. When the speed is within the safe speed limit, the guard locking device is allowed to open. If the speed exceeds the limit, a safe shutdown is initiated.
STARTING: Press the reset button to energize outputs of the MSR57. Then press the start button to turn on the motor. The motor will execute its programmed function.
SAFE LIMITED SPEED: Turn the key operated selector switch to the SLS position and remove the key. The MSR57 sends a command to the drive to go to its configured safe limited speed. When the motor reaches and stays at the limited speed, the guard locking door becomes unlocked. Grip the enabling switch to the middle position and enter the hazard area. Exit the hazard area while holding the GripSwitch. Switch the SLS request to run. Then press the reset button to allow the drive to rotate the motor at high speeds. The GripSwitch can then be released.
STOPPING: The e-stop can be pressed at any time to initiate a stop. If the speed exceeds the limit or the GripSwitch is released, a safe-off stop is initiated.

Fault Detection

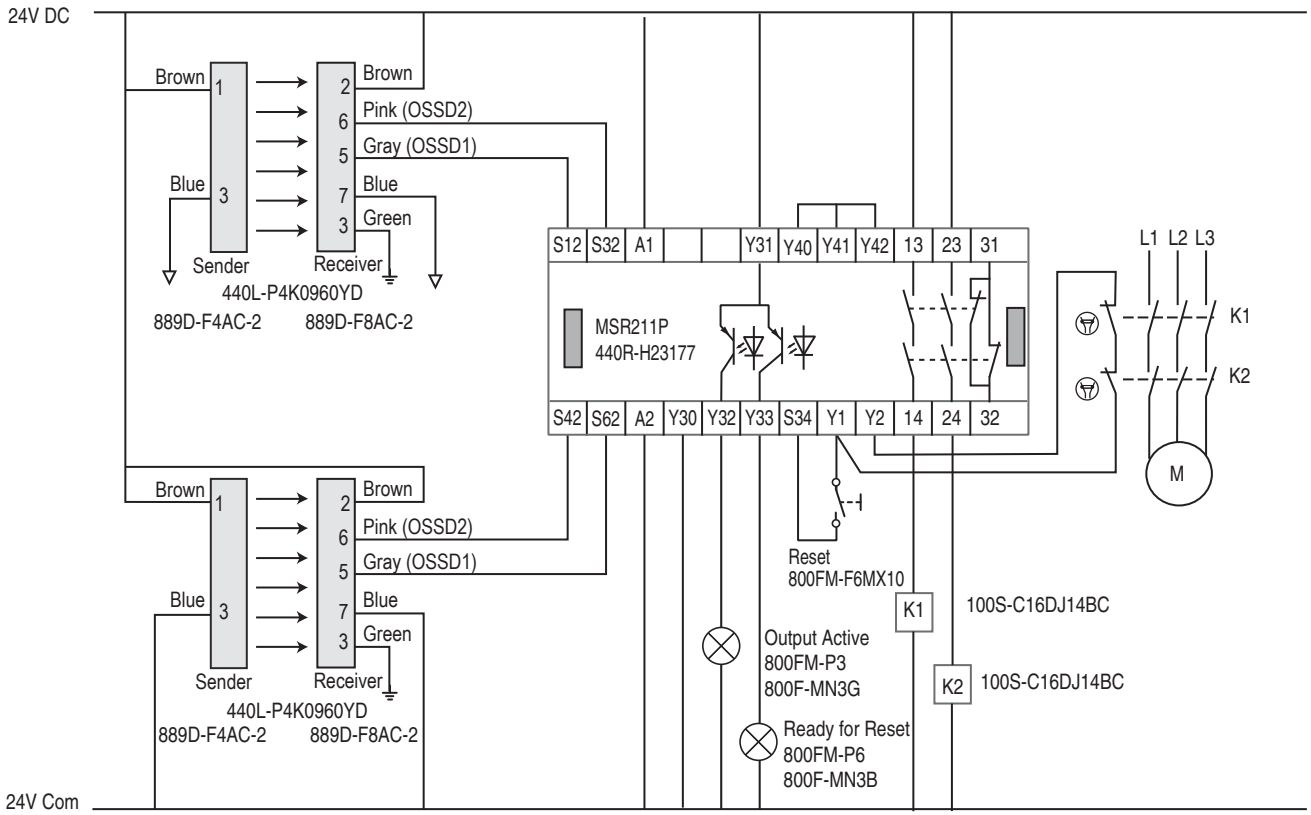
Upon power-up the MSR57 and PowerFlex 70 perform internal checks. The MSR57 generates continuous test pulses to check for short circuit at the input devices. Dual channel inputs and outputs provide single fault tolerance.

Ratings

The safety functions initiated by the 800F e-stop and TLS3-GD2 guardlocking device meet the safety performance requirements of SIL CL 2 per IEC 62061:2005 and has Category 3 structure that can be used in systems requiring Performance Levels up to PLd per ISO 13849-1: 2006. This example circuit performs a Stop Category 1 function (brake and then remove power to motor).

Modular Relay—Single Zone

GuardShield, 800F, MSR211, 100S



Circuit Status

Both light curtains are clear. The MSR211P output contacts are de-energized. The motor is off and ready to run.

Operating Principle

The MSR211P accepts two light curtains and functions as an alternative to a cascaded arrangement of light curtains.
STARTING: Press the reset button to energize the outputs of the MSR211P, which turns the motor on.
STOPPING: Obstructing either light curtain causes the motor to stop.

Fault Detection

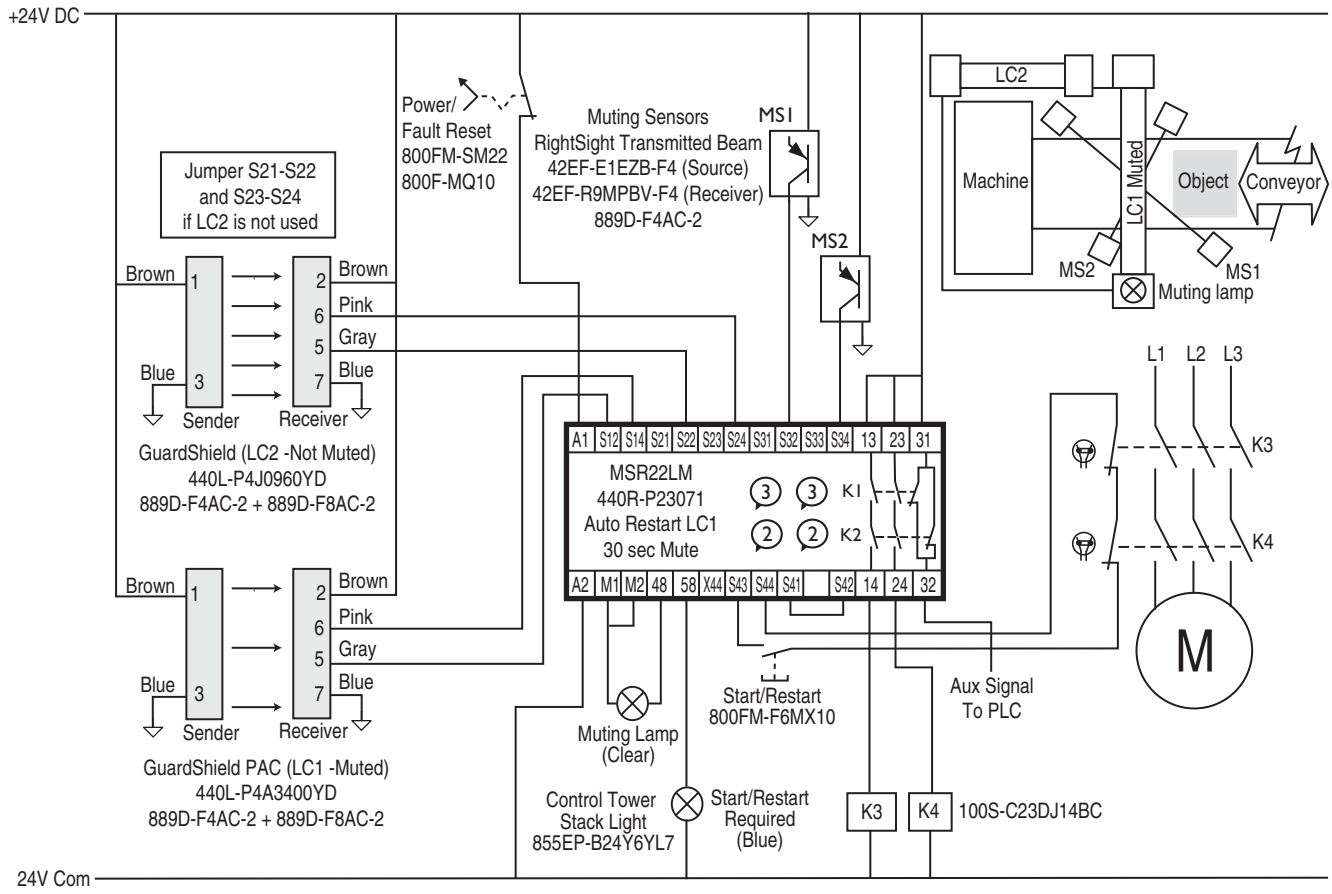
Upon successful completion of internal checks on power-up, the MSR211 checks the input signals from the GuardShield light curtains. If all four signals from the light curtains are present and no shorts exist, the MSR211P checks for the reset button. With the jumper from Y40 to Y42, the MSR211P checks to make sure the reset button is not held closed. When the reset button is pressed, the MSR211P checks the status of the two contactors. If the circuit on Y1/Y2 is closed, the MSR211 energizes its output. With the jumper from Y40 to Y41, the MSR2f11P confirms that both contactors are energized within 300 ms.

Ratings

The safety functions initiated by the two GuardShield light curtains meet the safety performance requirements of SIL CL 3 per IEC 62061:2005 and has Category 4 structure that can be used in systems requiring Performance Levels up to PLe per ISO 13849-1: 2006. This example circuit performs a Stop Category 0 function (coast to stop).

Light Curtain—Muting with Two Sensors

GuardShield, RightSight, 800F, Control Tower, MSR22LM, 100S



Circuit Status

The light curtain is clear. The muting sensors are clear. The outputs of the safety relay are de-energized, and the motor is off.

Operating Principle

The MSR22LM is designed for automated conveyor applications, where an object moves through a light curtain into or out of a hazardous area. With two sensor muting, the object can move in both directions.

STARTING: Upon initial power-up, the start/restart button must be pressed to energize the outputs of the MSR22LM and start the motor.

MUTING: The object must block the sensor MS1 and then MS2 prior to passing through the light curtain. After passing through the light curtain, the object must clear MS2 and then MS1 for the motor to continue running during the muting operation.

STOPPING: Obstructing the light curtain without blocking sensors MS1 and MS2 de-energizes the MSR22LM safety outputs. After clearing the light curtain, press the start/restart button to re-energize the safety outputs of the MSR22LM.

Fault Detection

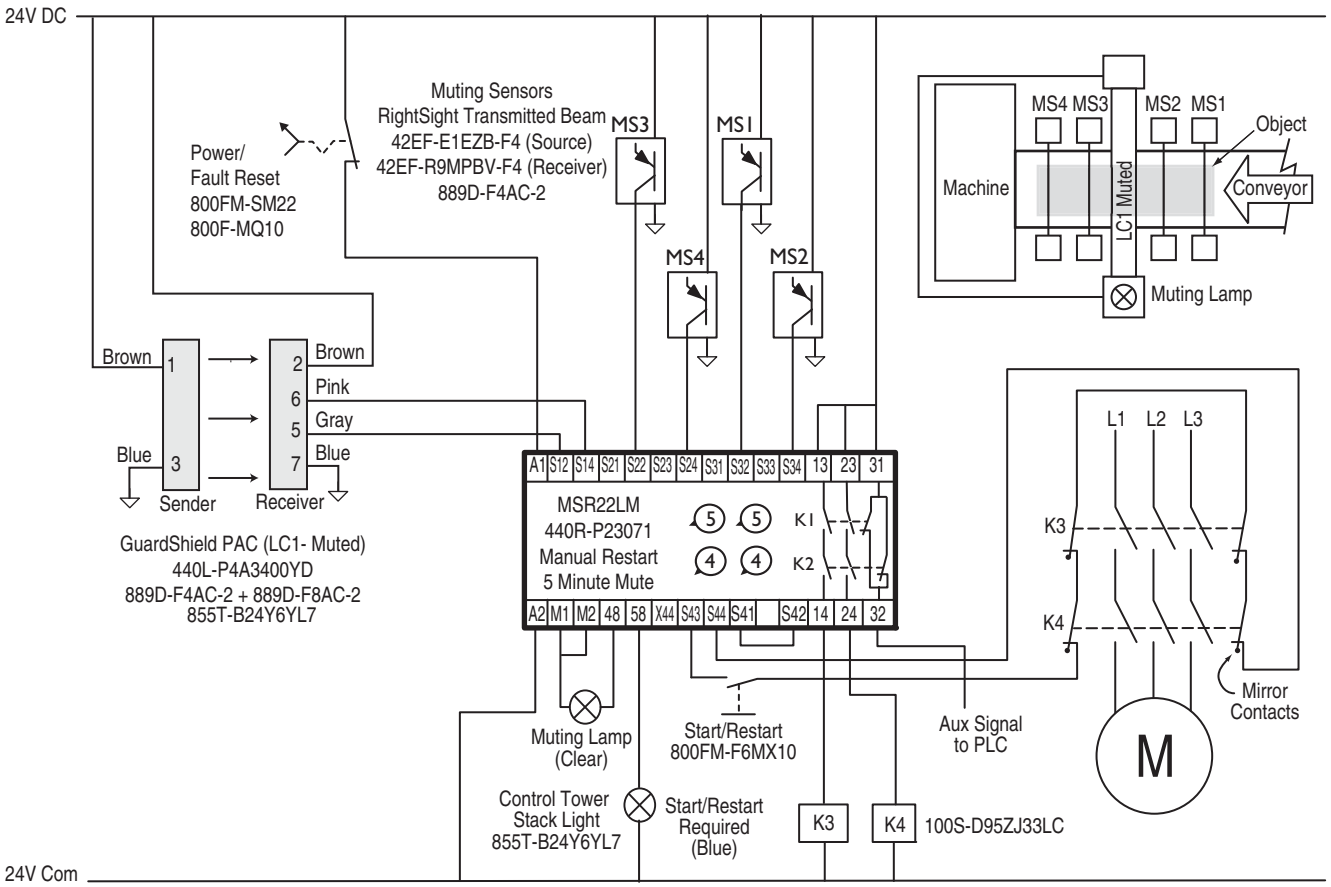
Upon power-up, the GuardShield and MSR22LM perform internal checks. If OK and clear, the GuardShield outputs turn on. The MSR22LM checks the muting inputs. If OK, the MSR22LM checks the light curtain for dual channel signals. If OK, the muting lamp blinks continuously and the start/restart required lamp turns on to indicate that the MSR22LM is ready to start. While running, an incorrect sequence of the muting sensors and light curtain operation or excessive time to move the object through the light curtain will de-energize the safety outputs of the MSR22LM. The run LEDs or the muting lamp blink at certain rates to indicate the type of fault that has occurred. The start/restart button can be held down for three seconds to manually move material through the conveyor. The motor will then run for 12 seconds. Some faults can be cleared by removing the object from the sensors. The start/restart required indicator will turn on when the MSR22LM is ready to go. Other faults may have to be cleared by cycling the power to the MSR22LM. The MSR22LM monitors the 100S contactors through mechanically linked contacts connected in series. If one contactor welds closed, the second contactor will stop the motor, and the MSR22LM will detect the fault at the next attempt to start the motor.

Ratings

The safety functions initiated by the two GuardShield light curtains meet the safety performance requirements of SIL CL 3 per IEC 62061:2005 and has Category 4 structure that can be used in systems requiring Performance Levels up to PLe per ISO 13849-1: 2006. This example circuit performs a Stop Category 0 function (coast to stop).

Light Curtain—Muting with Four Sensors

GuardShield, RightSight, 800F, Control Tower, MSR22LM, 100S



Circuit Status

The light curtain is cleared. The muting sensors are cleared. The outputs of the safety relay are de-energized, and the motor is off.

Operating Principle

The MSR22LM is designed for automated conveyor applications, where an object moves through a light curtain into or out of a hazardous area. With four sensor muting, the object can only move in one direction.

STARTING: Upon initial power-up, the start/restart button must be pressed to energize the outputs of the MSR22LM and start the motor.

MUTING: The object must block the sensors MS1 and MS2 prior to passing through the light curtain. The object must be large enough to block all four sensors, for the motor to continue running during the muting operation.

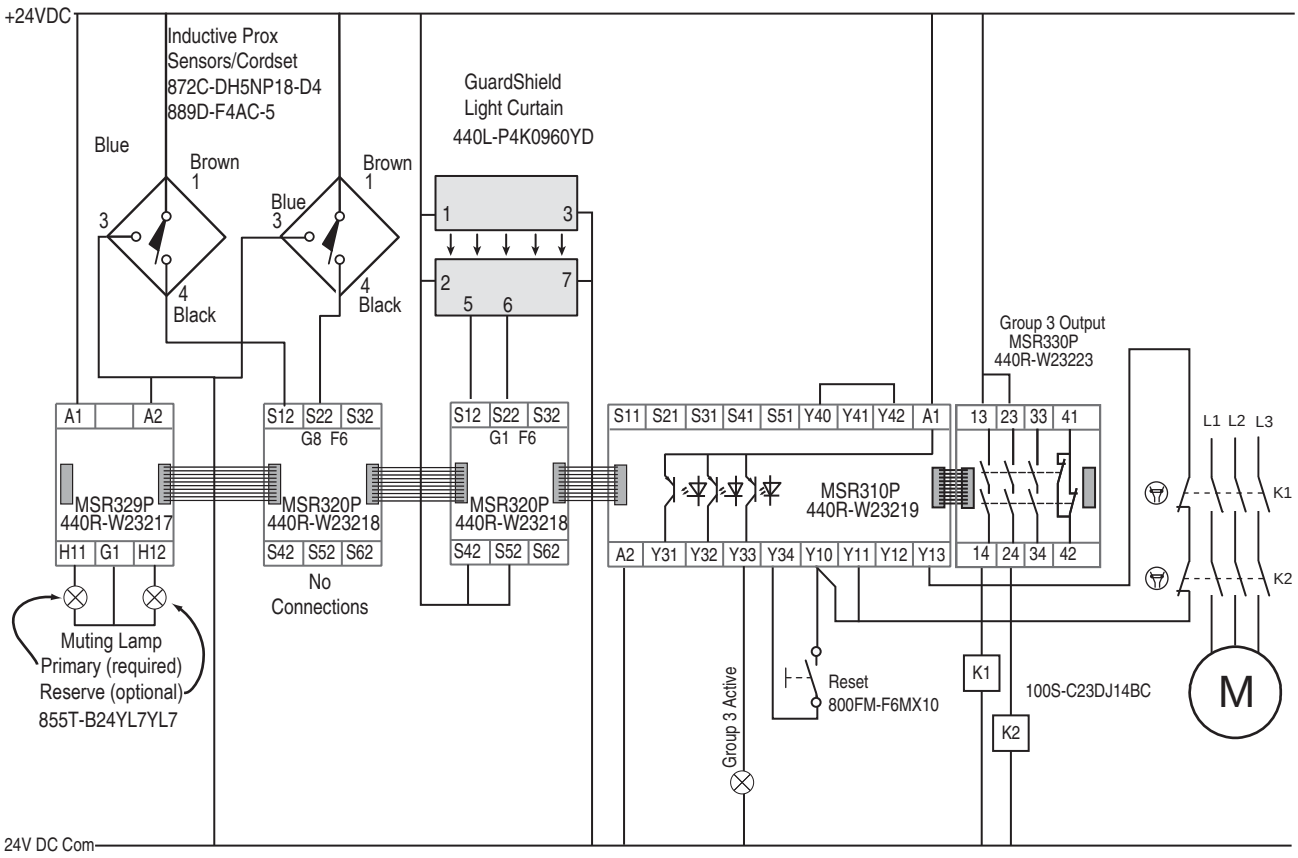
STOPPING: Obstructing the light curtain without blocking sensors MS1 and MS2 de-energizes the MSR22LM safety outputs. After clearing the light curtain, press the start/restart button to re-energize the safety outputs of the MSR22LM.

Fault Detection

Upon power-up, the GuardShield and MSR22LM perform internal checks. If OK and clear, the GuardShield outputs turn on. The MSR22LM checks the muting inputs. If OK, the MSR22LM checks the light curtain for dual channel signals. If OK, the muting lamp blinks continuously and the start/restart required lamp turns on to indicate that the MSR22LM is ready to start. While running, an incorrect sequence of the muting sensors and light curtain operation or excessive time to move the object through the light curtain will de-energize the safety outputs of the MSR22LM. The run LEDs or the muting lamp blink at certain rates to indicate the type of fault that has occurred. The start/restart button can be held down for three seconds to manually move material through the conveyor. The motor will then run for 12 seconds. Some faults can be cleared by removing the object from the sensors. The start/restart required button will turn on when the MSR22LM is ready to go. Other faults may have to be cleared by cycling the power to the MSR22LM. The MSR22LM monitors the 100S-D contactors through the mechanically linked "mirrored" contacts connected in series. If one contactor welds closed, the second contactor will stop the motor, and the MSR22LM will detect the fault at the next attempt to start the motor.

Ratings

The safety function initiated by the GuardShield light curtain meets the safety performance requirements of SIL CL 3 per IEC 62061:2005 and has Category 4 structure that can be used in systems requiring Performance Levels up to PLe per ISO 13849-1: 2006. This example circuit performs a Stop Category 0 function (coast to stop).



Circuit Status

The light curtain is clear. The inductive proximity sensors are clear. The MSR330P outputs are de-energized. The motor is off.

Operating Principle

The MSR300 is configured for a muting function. When both proximity sensors detect appropriate targets, the light curtain function is muted. The proximity sensors operate as a pair and do not have to operate in a specific sequence. The application must be an automatic process where the muting function is temporary. A muting lamp indicates when the muting function is active. The muting lamp is monitored. If the muting lamp burns out, the MSR300 will continue to function if a reserve lamp is present; otherwise the output stay off until the primary muting lamp is replaced.

STARTING: Press the reset button to energize all MSR330P outputs. The contactors K1 and K2 energize and the motor is turned on.

STOPPING: Obstructing the light curtain when the proximity sensors are not active will cause the MSR310P to de-energize and stop the motor.

Fault Detection

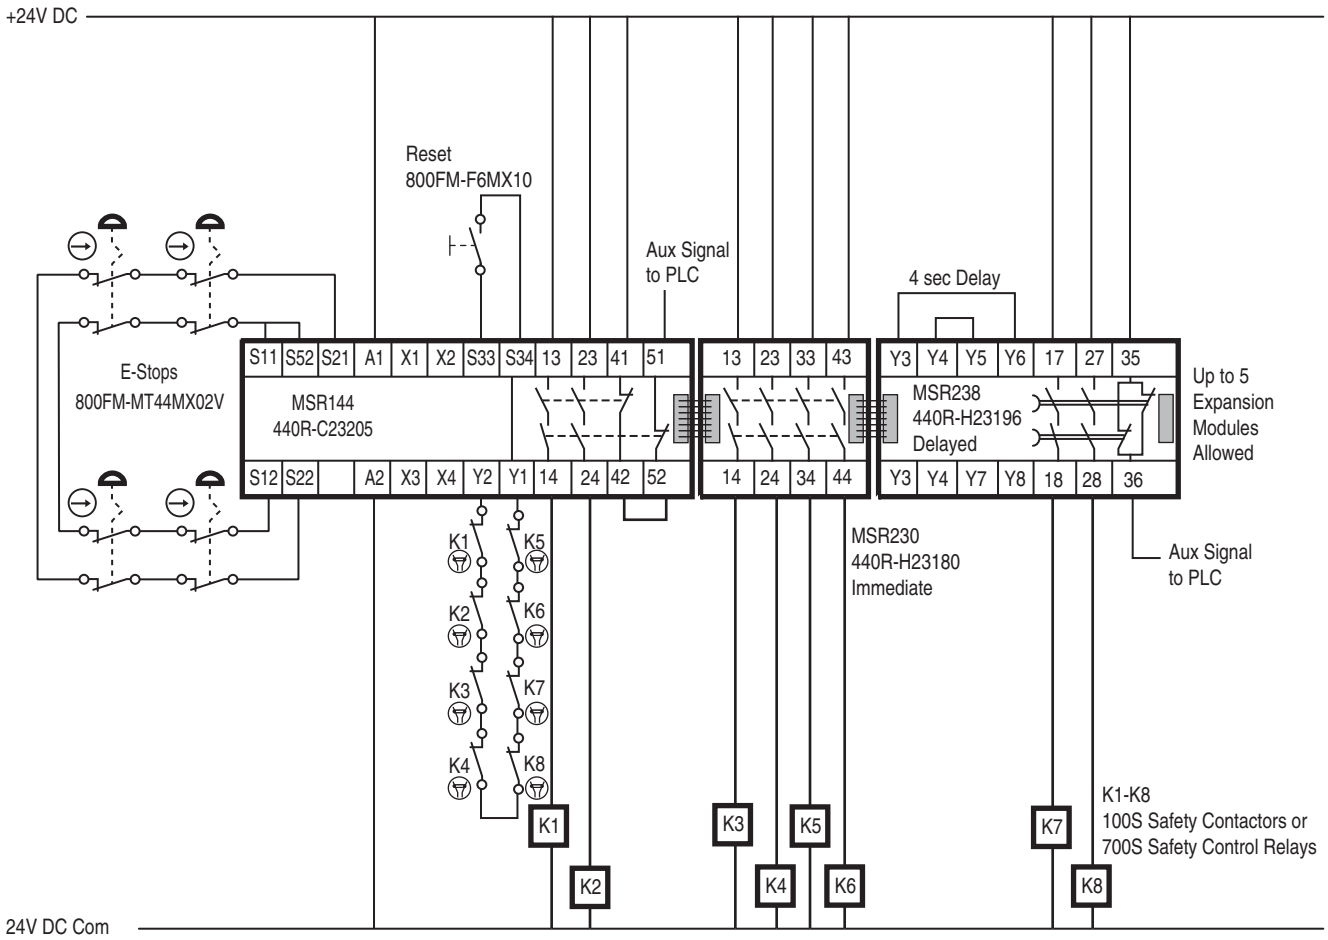
Upon successful completion of internal checks on power up, the MSR310P checks the input circuits. Shorts from the inputs to power, ground or other inputs will be detected immediately and will prevent energizing or will de-energize the MSR330P outputs. If one of the 100S output devices (K1 or K2) is stuck in an actuated state, the MSR310P will prevent startup because the Y10/Y13 feedback loop will remain open. The proximity sensors must be located in a way that prevents easy bypassing with spare targets.

Ratings

The safety function initiated by the GuardShield light curtain meets the safety performance requirements of SIL CL 3 per IEC 62061:2005 and has Category 4 structure that can be used in systems requiring Performance Levels up to PLe per ISO 13849-1: 2006. This example circuit performs a Stop Category 0 function (coast to stop).

Expandable Outputs—E-Stop with Immediate and Delayed Outputs

800F, MSR144, MSR230, MSR238, 100S, 700S



Circuit Status

The e-stop is reset. The safety outputs of the MSR144, MSR230 and MSR238 are de-energized. The motor is off.

Operating Principle

The MSR144 was chosen for its ability to expand its outputs with a combination of MSR230 and MSR238 modules. Up to five modules can be added to one MSR144. Ribbon cables on the front of the relay extend control of the MSR144 to MSR230 and MSR238. Without jumpers to X1/X2 and X3/X4, the MSR144 is set to monitored manual reset.

STARTING: Press and release the reset button to energize the outputs of the MSR144, MSR230 and MSR238. K1-K8 safety contactors or safety control relays energize to control the hazardous portion of the machine.

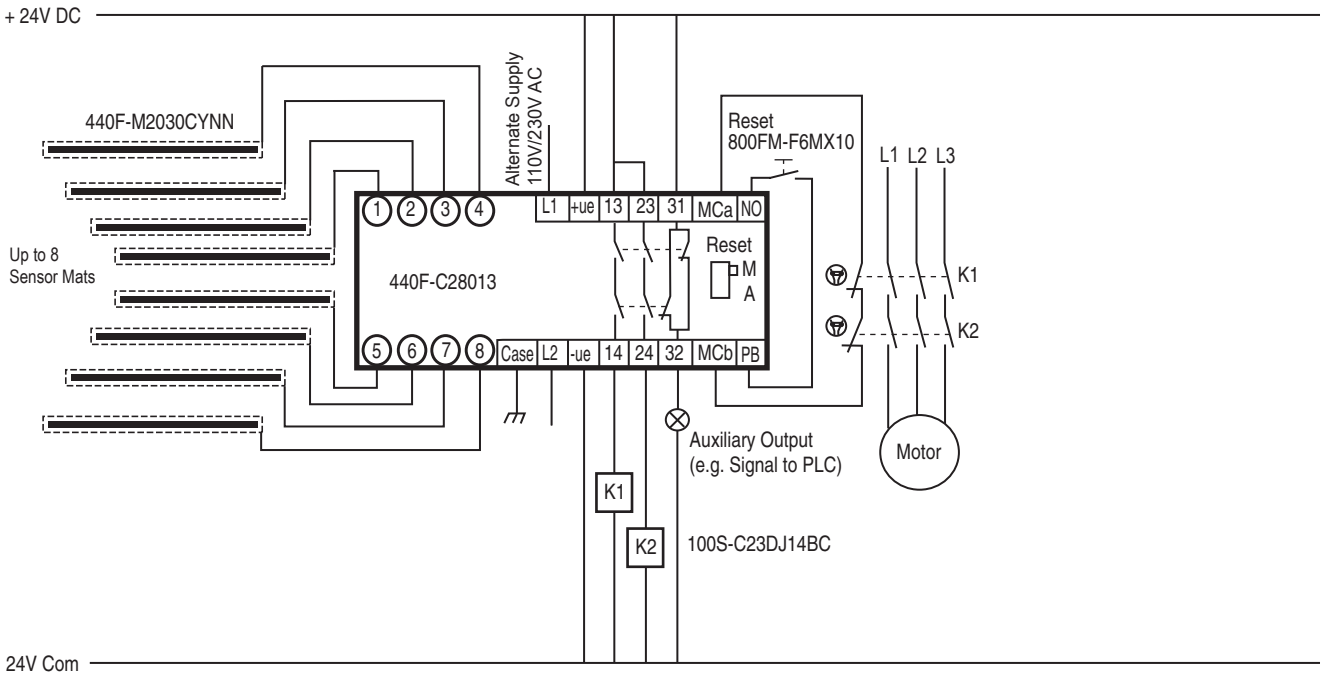
STOPPING: When an e-stop is pressed, the safety outputs of the MSR144 and MSR230 immediately turn off and de-energize K1-K6. Four seconds later, the safety outputs of the MSR238 turn off and de-energize K7 and K8.

Fault Detection

Upon power-up, the MSR144 performs internal checks. The checks also include verification that the MSR230 and MSR238 modules are in the off state. The MSR144 then looks for dual signals from the e-stop circuit. A crossfault on the e-stop circuit will be detected by the MSR144. With the e-stop signals made, closing the reset button places a voltage to the Y2 terminal. The external devices (K1 through K8) are checked to confirm they are off. A fault in K1 through K8 will cause their normally closed contacts to remain open, and this fault will be detected by the MSR144.

Ratings

The safety function initiated by the series connection of 800F e-stop buttons meets the safety performance requirements of SIL CL 2 per IEC 62061:2005 and has Category 3 structure that can be used in systems requiring Performance Levels up to PLd per ISO 13849-1: 2006. The Category 3 rating requires the redundant usage of K1-K8 to de-energize the machine actuators, and the contactors must be monitored by the safety system. This example circuit performs a Stop Category 0 function (coast to stop).



Circuit Status

There is no presence on the safety mats. The safety outputs of the Mat Manager are de-energized. The motor is off.

Operating Principle

The Mat Manager monitors up to eight mats, which are individually connected to the Mat Manager by M12 connectors. LEDs on the front of the Mat Manager indicate which mat is actuated as well as providing status LED for power and safety outputs.
STARTING: Press the reset button to energize the outputs of the Mat Manager.
STOPPING: Stepping on any of the safety mats will turn off the safety outputs of the Mat Manager and de-energize the K1 and K2 contactors.

Fault Detection

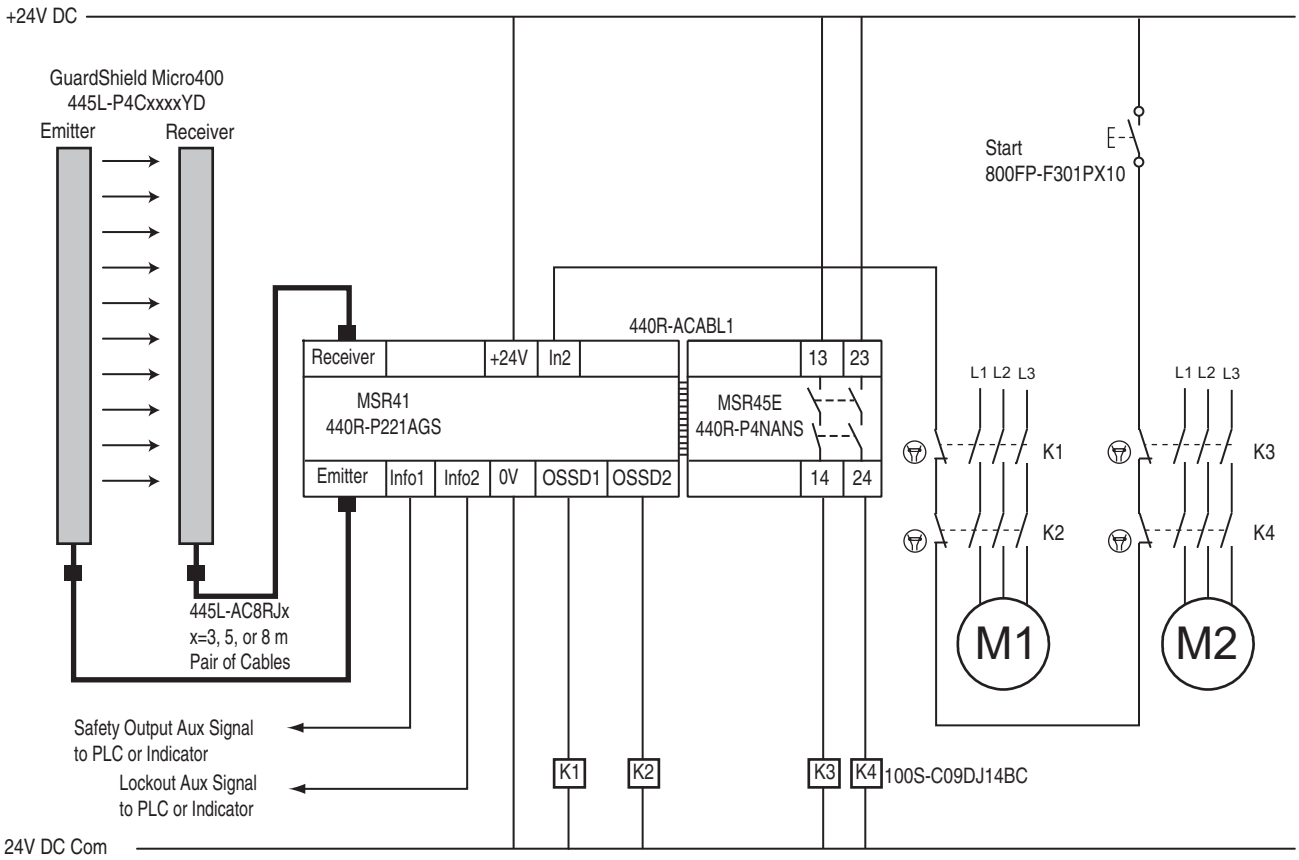
Upon power-up, the Mat Manager performs internal checks. The Mat Manager then looks for current flowing through each of the safety mats. A short or open circuit on any of the safety mats will be detected by the Mat Manager. With the safety mat signals made, the Mat Manager checks the reset button. With monitored manual reset selected, a short circuit or stuck pushbutton will be detected by the Mat Manager. Pressing the reset button, the Mat Manager checks the K1 and K2 contactors. A stuck or welded contactor will be detected by an open normally closed contact.

Ratings

The safety function initiated by the MatGuard safety mat meets the safety performance requirements of SIL CL 2 per IEC 62061:2005 and has Category 3 structure that can be used in systems requiring Performance Levels up to PLd per ISO 13849-1: 2006. This example circuit performs a Stop Category 0 function (coast to stop).

Micro400 Light Curtain with Controller and Expansion Module

Micro400, MSR41, MSR45E, 100S



Circuit Status

The light curtain is clear. K1, K2, K3 and K4 are off. The motors are off and ready to run.

Operating Principle

STARTING: Momentarily press the Start button. The OSSD safety outputs and the safety contacts 13/14 and 23/24 close. The contactors K1-K4 energize, and the motors M1 and M2 start.
STOPPING: Breaking the light curtain causes the OSSD safety outputs and the safety contacts 13/14 and 23/24 to open. The contactors K1-K4 drop out and the motors coast to a stop.

Removing the object from the light curtain will not cause the motor to run. The operator must momentarily close the Start switch to turn the motor on.

Fault Detection

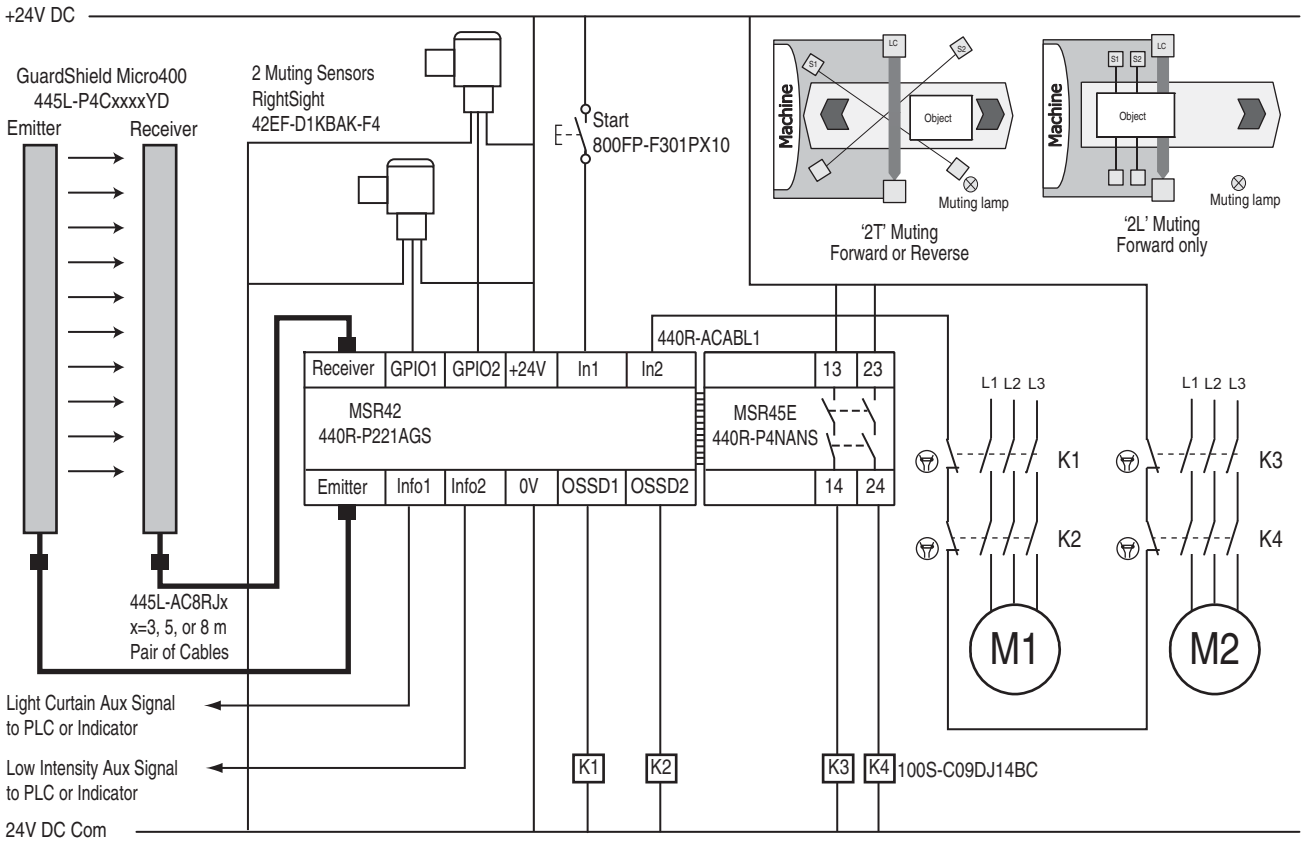
Upon successful completion of internal checks on power up, the GuardShield light curtain energizes its outputs with no objects present. The GuardShield light curtain outputs turn on. If a crossfault is detected, the GuardShield light curtain goes to a lockout state with its outputs off. After successful completion of internal checks, the MSR41 checks the signals from the light curtain. If it's okay, the MSR41 then checks the status of the K1-K4 contactors. If one of the pair of contactors fails in the actuated state, the other contactor will disconnect the motor. The MSR41 will detect the faulted contactor and will not allow the motor to restart until the fault is corrected.

Ratings

This circuit can meet the safety performance requirements of PLe per ISO13849-1: 2006 and SIL CL3 per IEC62061:2005. This circuit executes a Category 0 stop.

Two Sensor Muting with Micro400 Light Curtain

42EF, Micro400, MSR42, 100S



Circuit Status

The light curtain and muting sensors are clear. K1, K2, K3 and K4 are off. The motors are off and ready to run.

Operating Principle

STARTING: Momentarily press the Start button. The OSSD safety outputs turn on and the safety contacts 13/14 and 23/24 close. The contactors K1-K4 energize, and the motors M1 and M2 start.

MUTING: The MSR42 must be configured for two sensor L-type or T-type sensing. When the object passes by the sensors in the proper sequence, the light curtain becomes muted. The muting process is complete when the object passes by both sensors, and the light curtain becomes active again.

STOPPING: Breaking the light curtain causes the OSSD safety outputs and the safety contacts 13/14 and 23/24 to open. The contactors K1-K4 drop out and the motors coast to a stop.

Fault Detection

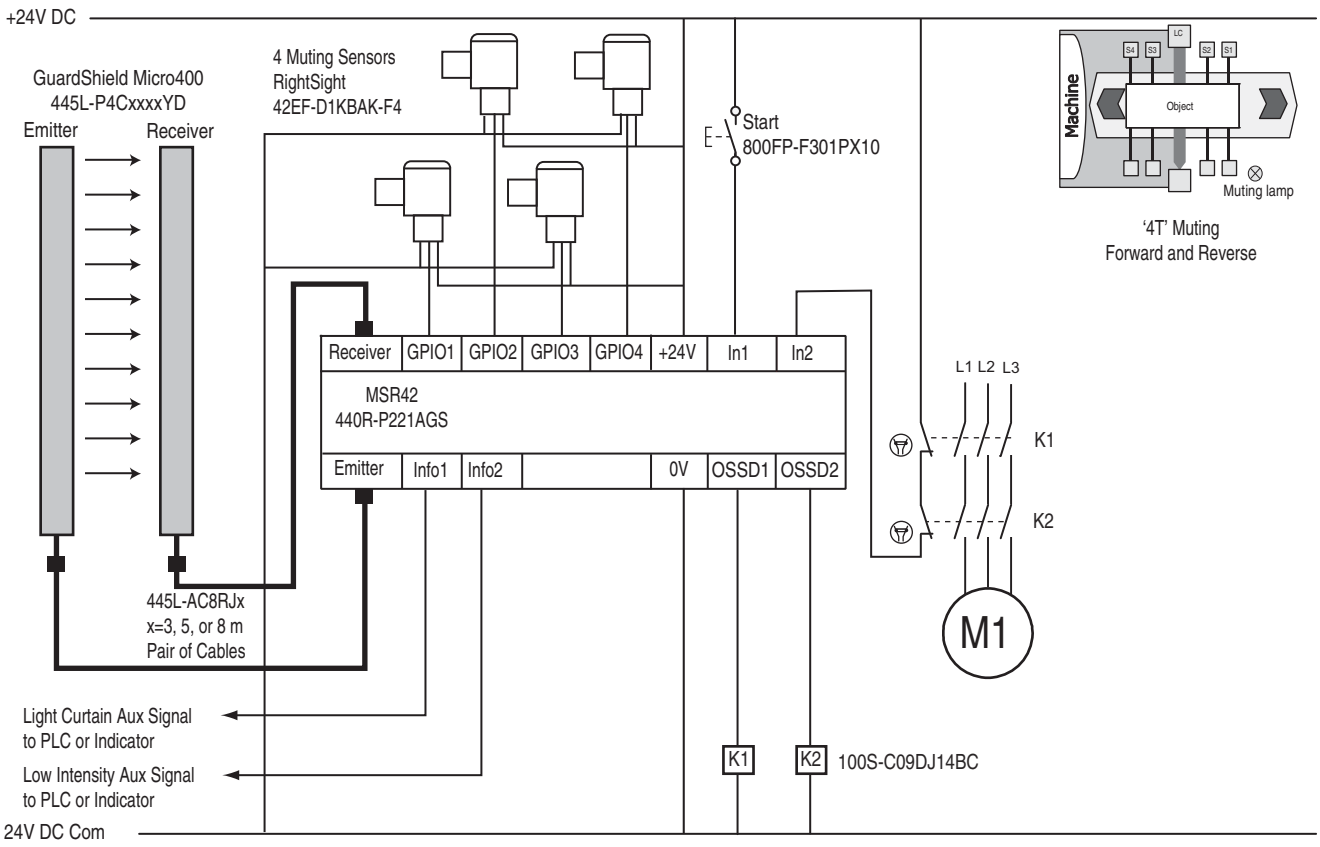
Upon successful completion of internal checks on power up, the GuardShield light curtain energizes its outputs with no objects present. The GuardShield light curtain outputs turn on. If a crossfault is detected, the GuardShield light curtain goes to a lockout state with its outputs off. After successful completion of internal checks, the MSR42 checks the signals from the light curtain. If it's okay, the MSR42 then checks the status of the four sensors and the K1 and K2 contactors. If a sensor is shorted in the ON state, the MSR42 will not allow the OSSD outputs to turn ON. If one of the contactors fails in the actuated state, the other contactor will disconnect the motor. The MSR42 will detect the faulted contactor and will not allow the motor to restart until the fault is corrected.

Ratings

This circuit can meet the safety performance requirements of PLe per ISO13849-1: 2006 and SIL CL3 per IEC62061:2005. This circuit executes a Category 0 stop.

Four Sensor Muting with Micro400 Light Curtain

42EF, Micro400, MSR42, 100S



Circuit Status

The light curtain and muting sensors are clear. K1 and K2 are off. The motor is off and ready to run.

Operating Principle

STARTING: Momentarily press the Start button. The OSSD safety outputs turn on. The contactors K1-K2 energize, and the motor M1 starts.
MUTING: The MSR42 must be configured for four sensor T-type sensing, with appropriate time settings. When the object passes by the sensors in the proper sequence, the light curtain becomes muted. The muting process is complete when the object passes by all the sensors and the light curtain becomes active again.
STOPPING: Violating the muting timing constraints and breaking the light curtain causes the OSSD outputs to turn off. The contactors K1-K2 drop out and the motors coast to a stop. If the object stops in the light curtain, the Start button can be used to temporarily override the muting function and energize the OSSD outputs.

Fault Detection

Upon successful completion of internal checks on power up, the GuardShield light curtain energizes its outputs with no objects present. The GuardShield light curtain outputs turn on. If a crossfault is detected, the GuardShield light curtain goes to a lockout state with its outputs off. After successful completion of internal checks, the MSR42 checks the signals from the light curtain. If it's okay, the MSR42 then checks the status of the four sensors and the K1 and K2 contactors. If a sensor is shorted in the ON state, the MSR42 will not allow the OSSD outputs to turn ON. If one of the contactors fails in the actuated state, the other contactor will disconnect the motor. The MSR42 will detect the faulted contactor and will not allow the motor to restart until the fault is corrected.

Ratings

This circuit can meet the safety performance requirements of PLe per ISO13849-1: 2006 and SIL CL3 per IEC62061:2005. This circuit executes a Category 0 stop.

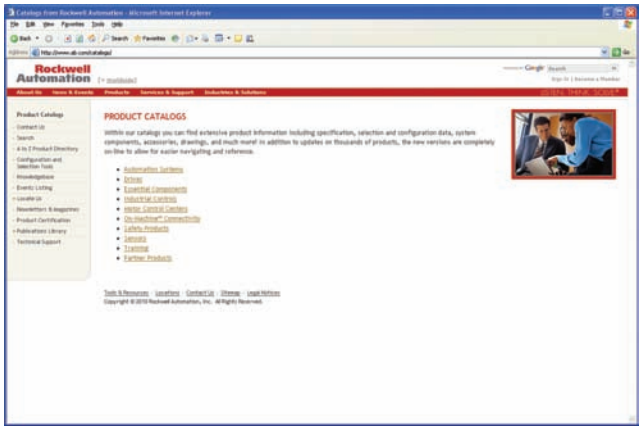
On-Line Resources



Safety Products Catalog
www.ab.com/catalogs

For the most current version of the Safety Products catalog, visit the Allen-Bradley catalog web site at www.ab.com/catalogs. With our on-line catalog, you can search for information by product type or by catalog number.

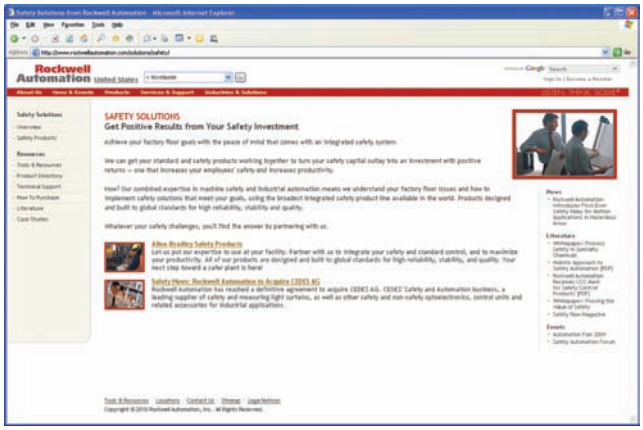
On-line catalogs are updated regularly, so come back often to find the latest information!

Safety Products
www.rockwellautomation.com/solutions/safety

Achieve your factory floor goals with the peace of mind that comes with an integrated safety system.

We can get your standard and safety products working together to turn your safety capital outlay into an investment with positive returns – one that increases your employees' safety and increases productivity.

How? Our combined expertise in machine safety and industrial automation means we understand your factory floor issues and how to implement safety solutions that meet your goals, using the broadest integrated safety products line available in the world. Products designed and built to global standards for high reliability, stability, and quality.



KnowledgeBase
www.rockwellautomation.com/knowledgebase

The Rockwell Automation KnowledgeBase is your first resource for technical information support, on-line 24x7x365. Increase your productivity by finding solutions to technical questions more quickly—saving both time and money.

Maintained by highly trained support engineers who use this tool themselves, the KnowledgeBase provides you with search functions including a natural language option and the ability to personalize and save default search criteria easily. These functions help you to find answers and resolve issues quickly and easily, and these benefits only improve with time as you use the tool!

MINOTAUR MSR121RT

(a) **MONITORING SAFETY RELAY**
ÜBERWACHUNGS-/SICHERHEITSRELAIS
RELAIS DE SECURITE POUR CONTROLE

(b) Installation Instructions — Einbauanleitung — Notice D'installation

RETAIN THESE INSTRUCTIONS

Installation must be in accordance with the following steps and must be carried out by suitably competent personnel.
This device is intended to be part of the safety related control system of a machine. Before installation, a risk assessment should be performed to determine whether the specifications of this device are suitable for all foreseeable operational and environmental characteristics of the machine to which it is to be fitted.
At regular intervals during the life of the machine check whether the characteristics foreseen remain valid.
Guardmaster cannot accept responsibility for a failure of this device if the procedures given in this sheet are not implemented or if it is used outside the recommended specifications in this sheet.
Exposure to shock and/or vibration in excess of those stated in IEC 68 part: 2-6/7 should be prevented.
Adherence to the recommended inspection and maintenance instructions forms part of the warranty.

DIESE ANLEITUNG AUFBEWAHREN

Die Installation muß unter Einhaltung der nachstehend beschriebenen Schritte, und durch geeignetes, fachlich qualifiziertes Personal erfolgen.
Diese Vorrichtung ist als Teil des sicherheitsrelevanten Kontrollsystems einer Maschine vorgesehen. Vor der Installation sollte eine Risikobewertung zur Festlegung dessen erfolgen, ob die Spezifikationen dieser Vorrichtung für alle vorhersehbaren betrieblichen und umweltbezogenen Eigenschaften der jeweiligen Maschine geeignet sind, an der sie installiert werden soll.
In regelmäßigen Abständen während der Lebensdauer der Maschine ist zu überprüfen, ob die vorhergesehenen Eigenschaften weiterhin gültig sind.
Guardmaster kann keinerlei Verantwortung für ein Versagen dieser Vorrichtung übernehmen, wenn die in diesem Schriftblatt gegebenen Verfahrensweisen nicht implementiert wurden, oder wenn sie außerhalb der auf diesem Schriftblatt empfohlenen Spezifikationen verwendet wird.
Eine Aussetzung an Stoßbelastungen und/oder Vibrationen, die überhalb den in IEC 68, Teil 2-6/7 angegebenen Werten liegen, sollte verhindert werden.
Die Einhaltung der empfohlenen Inspektions- und Wartungsvorschriften ist Teil der Garantie.

CONSERVEZ CES INSTRUCTIONS

L'installation doit être effectuée conformément aux instructions suivantes, par des membres qualifiés du personnel.
Ce dispositif est étudié pour être incorporé dans le système de contrôle pour la sécurité d'une machine. Avant l'installation, on doit effectuer une évaluation des risques pour déterminer si les spécifications de ce dispositif sont appropriées pour toutes les caractéristiques de service et du milieu d'utilisation prévues pour la machine sur laquelle il sera monté.
Vérifier, à des échéances régulières au cours de la vie de la machine, que les caractéristiques prévues sont toujours valables. Guardmaster décline toute responsabilité pour les défaillances de cet appareil si les procédures décrites dans la présente notice ne sont pas appliquées ou si l'appareil est utilisé hors des spécifications recommandées dans cette même notice.
Eviter toute exposition à des chocs et/ou des vibrations supérieurs à ceux qui sont spécifiés dans la norme IEC 68 part. 1-6/7.
Le respect des instructions relatives à l'inspection, au contrôle et à l'entretien de cet appareil rentre dans l'application de la garantie.

(c) Mode of Operation — Funktionsweise — Mode de Fonctionnement

The dual channel operation shown in wiring example 1 includes crossfault monitoring between both E-stop circuits. That means in case of shorts between the two E-stop channels the **MSR121** will de- activate the outputs. This is achieved by an electronic protection circuit in the safety relay. The LEDs CH1 and CH2 will go out and power LED will start flashing during the activation. After elimination of the malfunction, the MSR121 is ready for operation again. The application with monitored start checks the start circuit (S33/S34) and will only activate the MSR121 if there is a leading edge in this circuit. If wired for autostartfunction the **MSR121** will be activated automatically by the supply voltage if the E-stop circuits and the feedback loop (X5/S33) are closed. In applications, where both E-stop circuits are not closed simultaneously, (e.g. safety gates) channel 2 has to be activated before channel 1. If the inputs will be activated with external 24VDC , the negative pole has to be connected to A2 (Light curtain application). The open collector semiconductor output may transfer the status of the MSR121 via the terminals Y31-Y32 direct to a PLC. To control NC contacts from external contactors the feedback loop has to be wired in series between the start button respectively X5 and S33 (Autostart).

Bei 2-kanaliger Ansteuerung gemäß Schaltungsbeispiel 1 besteht Querschlußsicherheit. Das heißt, bei Betätigung einer Schaltmatte in Vierleitertechnik (Schaltungsbeispiel 2) oder einem Leitungsschluß spricht eine elektronische Sicherung im Gerät an und schaltet das **MSR121** aus.
Während des Querschlusses erlöschen die LEDs CH1 und CH2 und LED PWR beginnt zu blinken. Nach Beseitigung der Ursache bzw. Freigabe der Schaltmatte ist das **MSR121** sofort wieder betriebsbereit.
Die Funktion des Starttasters wird bei jedem Einschaltvorgang überprüft.
Ist der Eintaster vor dem Entriegeln der Not-Aus-Taster oder Anlegen der Versorgungsspannung geschlossen, ist kein Start möglich. Soll das Gerät automatisch über die Versorgungsspannung eingeschaltet werden, so sind die Kontakte X5 und S33 zu brücken. Werden beide Not-Aus Kreise nicht gleichzeitig angesteuert (z.B. bei einer Schutztür überwachung), so muß Kanal 2 vor Kanal 1 geschlossen werden. Werden die Eingänge des **MSR121** extern mit 24 VDC angesteuert (Lichtgitteransteuerung), so ist *das negative Potential mit A2 zu verbinden. Der Open- Collector* Halbleiterausgang kann über die Klemmen Y31-Y32 direkt den *Schaltzustand des **MSR121** an eine SPS melden. Zu überwachende* Öffnerkontakte von externen Erweiterungen sind in Reihe mit dem *Starttaster bzw. zwischen X5 und S33 (bei Auto-Start) zu schalten.*

Le fonctionnement bi-canal illustré dans l'exemple de câblage nº1 prévoit le contrôle des défaillances entre les deux circuits d'arrêt d'urgence. En cas de court-circuit entre les deux canaux d'arrêt d'urgence, le **MSR121** désactive les sorties grâce à un circuit de protection électronique prévu dans le relais de sécurité. Après élimination de la défaillance, le **MSR121** est à nouveau prêt à fonctionner. L'application à démarrage contrôlé vérifie le circuit de démarrage (S33/S34) et active uniquement le **MSR121** en présence d'un front d'attaque dans le circuit. Si la fonction de démarrage automatique est prévue, le **MSR121** est automatiquement activé à la mise sous tension si les circuits d'arrêt d'urgence et la boucle de feed-back (X5/S33) sont fermés. Dans les applications où les deux circuits d'arrêt d'urgence se ferment simultanément (par ex. les portes de sécurité), le canal 2 doit être activé avant le canal 1. Si les entrées sont activées par une alimentation externe de 24 V c.c., le pole négatif doit être connecté à la borne A2 (barrières photoélectriques). La sortie à semi-conducteur à collecteur ouvert peut directement transmettre à un PC l'état du MSR121 à partir des bornes Y31-Y32. Pour commander les contacts normalement fermés à partir de contacteurs externes, câbler la boucle de feed-back en série entre le bouton de démarrage, soit respectivement X5 et S33 (démarrage automatique).

(f) Technical Specifications

Standards	IEC/EN60204-1, ISOTR12100 ISO13849-1 (EN954-1)
Safety Category	Cat. 4 per EN954-1
Approvals	CE marked for all applicable directives
Power Supply	24V AC/DC, 115/230V AC 0.8 to 1.1 x rated voltage 50/60 Hz
Power Consumption	4W
Safety Inputs	1 N.C., 2 N.C. or light curtain
Input Simultaneity	Infinite
Maximum Input Resistance	45 ohms
Reset	Auto./Manual or Monitored Manual
Outputs	3 N.O. Safety, 1 N.C. Auxiliary 1 S.S. PNP Aux.
Output Rating EM-Relay	A300, AC-15, 6A/250V AC
A300/N300 ref.: I_{th}, U_i	N300,DC-13, 3A/24V DC
SS	20mA@24V DC
Fuses Output (external)	6A Slow Blow or 10A Quick Blow
Contact Material	$AgSnO_2$ + 0.5µAu
Min. Switched Current/Voltage	10mA/10V
Power On Delay	1s
Response Time 24V DC	15ms
24/115/230V AC	20ms
Recovery Time	> 2s
Impulse Withstand Voltage	2500V
Operating Temperature	-5°C to +55°C (+23°F to 131°F)
Humidity	90% RH
Enclosure Protection	IP40 (NEMA 1), DIN 0470
Terminal Protection	IP20, DIN 0470
Electronic Short Circuit protection	Inputs & solid state output
Conductor Size	0.2-4mm² (24-12AWG)
Installation Group	C in accordance with VDE 0110
Pollution Degree	2
Mounting	35mm DIN rail
Weight 24V DC	290g (0.64 lbs)
110 and 230V AC	370g (0.82 lbs)
Electrical Life	
220V AC/4A/880VA cosφ=0.35	100,000 operations
220V AC/1.7A/375VA cosφ=0.6	500,000 operations
30V DC/2A/60W	1,000,000 operations
10V DC/0.01A/0.1W	2,000,000 operations
Mechanical Life	2,000,000 operations
Vibration	10-55 Hz, 0.35mm
Shock	10g, 16ms, 100 shocks

Technische Daten

Normen	IEC/EN60204-1, ISOTR12100 ISO13849-1 (EN954-1)
Schutzkategorie	Kat. 4 nach EN954-1
Zulassungen	CE-Kennzeichnung für alle zutreffenden Direktiven
Spannungsversorgung	24V AC/DC, 115/230V AC 0,8 bis 1,1 x Nennspannung, 50/60 Hz
Leistungsverbrauch	4W
Schutzeingänge	1 oder 2 Ruhekontakte oder Lichtschranke
Eingangsgleichzeitigkeit	Unbegrenzt
Max. Eingangswiderstand	45 ohms
Rückstellung	automatische/manuelle oder überwachte manuelle
Ausgänge	3 Arbeitskontakt-Sicherheitsausgänge, 1 Ruhekontakt-Hilfsausgang
	1 Halbleiterausgang PNP
Ausgangsnennbelastung EM-Relais	A300, AC-15, 6A/250V AC
A300/N300 ref.: I_{th}, U_i	N300, DC-13, 3A/24V DC
Halbleiter	20mA@24V DC
Sicherungen Ausgang (extern)	6A träge oder 10A flinke
Kontaktmaterial	$AgSnO_2$ + 0.5µAu
Min. geschalteter Strom/Spannung	10mA/10V
Strom-ein-Verzögerung	1s
Reaktionszeit 24V DC	15ms
24/115/230V AC	20ms
Erholungszeit	> 2s
Stehstossspannung	2500V
Betriebstemperatur	-5°C bis +55°C (+23°F bis 131°F)
Feuchtigkeit	90% RF
Gehäuseschutz	IP40 (NEMA 1), DIN 0470
Klemmenschutz	IP20, DIN 0470
Elektronischer Kurzschlussschutz	Eingänge & Halbleiterausgänge
Leiterquerschnitt	0.2-4mm² (24-12AWG)
Installationsgruppe	C gemäß VDE 0110
Verschmutzungsgrad	2
Befestigung	35mm DIN-Schiene
Gewicht 24V DC	290g (0.64 lbs)
110 and 230V AC	370g (0.82 lbs)
Elektrische Lebensdauer	
220V AC/4A/880VA cosφ=0.35	100.000 Betätigungen
220V AC/1.7A/375VA cosφ=0.6	500.000 Betätigungen
30V DC/2A/60W	1,000,000 Betätigungen
10V DC/0.01A/0.1W	2,000,000 Betätigungen
Mechanische Lebensdauer	2,000,000 Betätigungen
Vibration	10g 10-55 Hz
Stösse	10g, 16ms, 100 Stösse

Spécifications Techniques

Normes	IEC/EN60204-1, ISOTR12100 ISO13849-1 (EN954-1)
Classe de sécurité	Cat. 4 selon EN954-1
Homologations	label CE pour toutes les directives applicables
Alimentation électrique	24V c.a./c.c., 42/115/230V c.a. 0,8 à 1,1 x tension nominale, 50/60 Hz
Consommation	4W
Contacts d'entrée de sécurité	1 ou 2 contacts N/F ou barrière photoélectrique
Simultanéité des entrées	infinie
Résistance maximale d'entrée	45 ohms
Entrées de sécurité	Auto / manuelle ou manuelle contrôlée
Contacts de sortie	3 N/O sécurité, 1 auxiliaire N/F 1 S.S. PNP Aux.
Puissance nominale contacts sortie	A300, c.a.-15, 6 A / 250 V c.a.

10V c.c./0.01A/0.1W	2,000,000 d'opérations
Durée de vie mécanique	2,000,000 d'opérations
Vibrations	10g, 10-55 Hz
Chocs	10g, 16ms, 100 chocs

(g) REPAIR

If there is any malfunction or damage, no attempts should be made to repair it. The unit should be replaced before machine operation is allowed.
DO NOT DISMANTLE THE UNIT.

REPARATUR

Falls Fehlfunktionen oder Schäden auftreten, keine Versuche zur Reparatur unternehmen. Der Schalter muß ersetzt werden, bevor die Maschine wieder gestartet wird.
GERÄT DARF NIEMALS GEÖFFNET WERDEN!

REPARATION

Dans l'éventualité d'un problème technique ou d'une détérioration de cet appareil, il doit être remplacé immédiatement avant la remise en production de la machine.
DANS TOUS LES CAS, NE DISLOQUEZ PAS L'APPAREIL.

CE Declaration of Conformity / Konformitätserklärung / Déclaration de conformité

This is to declare that the MSR121RT conforms with the Essential Health & Safety Requirements (EHSR's) of the European Machinery Directive (98/37/EC), the relevant requirements of the Low Voltage Directive (73/23/EEC as amended by 93/68 EEC) and the essential protection requirements of the EMC Directive (89/336/EEC as amended by 92/31 EEC). The MSR121RT also conforms to EN 292, EN 60204-1, EN 954-1, UL 508.

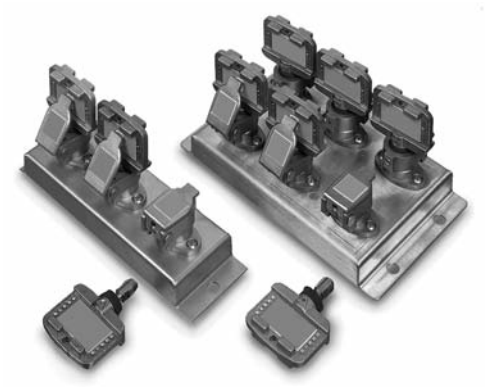
Change No:



Description

The key exchange unit (KEX) is used in an interlocking sequence to link together other devices in the Prosafe range and caters to more complex operating sequences.

The operating principle is such that no secondary keys can be removed from the unit until all primary keys have been inserted, rotated, and trapped. The primary keys remain trapped until all secondary keys have been re-inserted, rotated, and trapped.

It is typically used in applications where there is more than one access way to the hazardous area, and each access way must be open at the same time. The key exchange unit accomplishes this by allowing one or more keys to be inserted which then releases multiple keys out.

A typical process may require a rotary key switch to turn a motor off. The key from the rotary switch is removed and inserted into a KEX. The KEX then releases three keys which would allow simultaneous access to the hazard area through three different gates. This KEX is described as 1 key in 3 keys out. The keys in are considered primary codes, so the keys are not included in the KEX. The keys out are considered secondary codes, so the keys are included.

Features

- A range of off-the-shelf units in various combinations
- 316L stainless steel construction
- Primary key(s) in release secondary keys simultaneously on units up to six ways
- Weatherproof stainless steel dust cap as standard
- Replaceable code barrel assembly

Duct Heater - All applications must consider the airflow velocity, the desired outlet temperature, the correct watt density, and the mounting support.

Call ASB Heating Elements Ltd., for Technical Assistance: 1-800-265-9699

Duct Heater

Forced Air Duct Heater - for Industrial Process Heating Only

Ovens often require re-circulated air, or forced circulation, to perform the desired heating task. A duct heater mounted in this re-circulated air stream is an effective way to provide this heat, without having any electrical connections inside your oven.

Typical Applications

- heat treating, up to1000°F (540°C)
- curing
- baking
- drying
- batch heating
- conveyor systems

Typical Air Heat Calculation

$$kW = \frac{SCFM \times temperature\ rise}{3000}$$

kW - kilowatts
SCFM - standard cubic feet per minute
Temperature rise - number of degrees Fahrenheit increase required

A 20% safety factor is highly recommended

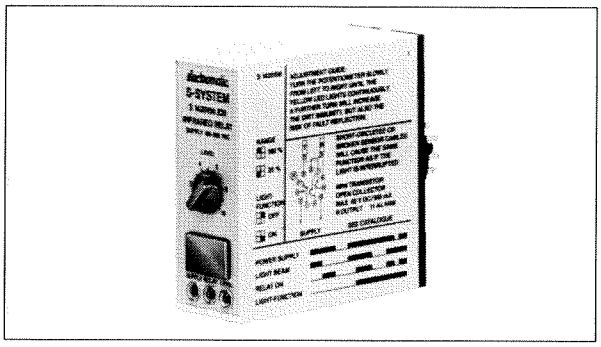
CARLO GAVAZZI



- Amplifier relay for photoelectric switches
- Sensivity range DIP-switch selectable
- Sensivity adjustment by potmeter
- Dirt accumulation alarm and alignment control
- Timer functions
- Modulated and synchronized light
- Make and break switching funct. DIP-switch selectable
- Rated operational voltage:
  24 VDC or VAC, 115 VAC, 230 VAC
- Output 10 A/250 V SPDT relay and 100 mA NPN
- LED indications: Power supply, output, level
- Plug-in module

Product Description

Amplifier relay for long-range photoelectric switch types MIF, MKF, MHF, MCF, MDF, MMF, MNF and MFFD. Carlo Gavazzi "S-System" plug-in housing. Adjustable sensitivity, high and low range selection with LED indication. Misalignment and dirt accumulation alarm output. Make and break switching function DIP-switch selectable. Short-circuit protected supply to photoelectric switches. ON-delay and OFF-delay adjustable from 0 to 10 s on S1421 types.

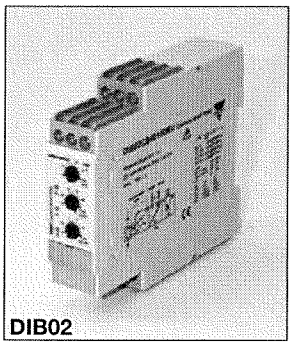
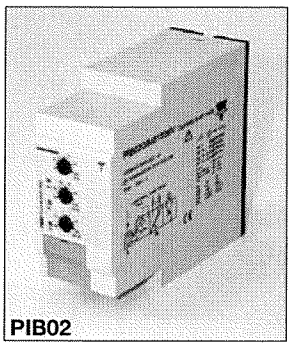
Monitoring Relays
1-Phase True RMS AC/DC Over or Under Current
Types DIB02, PIB02

CARLO GAVAZZI



DIB02



PIB02

- TRMS AC/DC over or under current monitoring relays
- Current measuring through external shunt or CT
- Selection of measuring range by DIP-switches
- Measuring ranges from 6 to 150 mV AC/DC and 0.4 to 4 V_p AC (MI or MP range)
- Adjustable current on relative scale
- Adjustable hysteresis on relative scale
- Adjustable delay function (0.1 to 30 s)
- Programmable latching or inhibit at set level
- Output: 8 A SPDT relay N.D. or N.E. selectable
- For mounting on DIN-rail in accordance with DIN/EN 50 022 (DIB02) or plug-in module (PIB02)
- 22.5 mm Euronorm housing (DIB02) or 36 mm plug-in module (PIB02)
- LED indication for relay, alarm and power supply ON
- Galvanically separated power supply

Product Description

DIB02 and PIB02 are precise TRMS AC/DC over or under current (selectable by DIP-switch) monitoring relays.
The current is measured through an external shunt. 1-phase and 3-phase current up to 500 AAC can be monitored connecting MI or MP current transformers.

Owing to the built-in latch function, the ON-position of the relay output can be maintained. Inhibit function can be used to avoid relay operation when not desired (maintenance, transitions).
The LED's indicate the state of the alarm and the output relay.

Housing dimensions	
Din-rail version	22.5 x 80 x 99.5 mm
Plug-in version	36 x 80 x 87 mm
Weight	Approx. 150 g
Screw terminals	
Tightening torque	Max. 0.5 Nm acc. to IEC 60947
Approvals	UL, CSA (except 748)
CE Marking	Yes
EMC	Electromagnetic Compatibility
Immunity	According to EN 61000-6-2
Emission	According to EN 50081-1

Mode of Operation

DIB02 and PIB02 monitor both AC and DC over or under current through an external shunt.

When connected with MI or MP current transformer (using the 0.4 to 4 V_p range) they can monitor 1-phase or 3-phase AC current up to 500 A.

Example 1
(connection between terminals Z1, Y1 or 8, 9 - latching function enabled)

The relay operates and latches in operating position when the measured value exceeds (or drops below) the set level for more than the set delay time.
Provided that the current has dropped below (or has exceeded) the set point (see hysteresis setting), the relay releases when the interconnection between terminals Z1, Y1 or 8, 9 is interrupted or the power supply is interrupted as well.
The red LED flashes until the delay time has expired or the measured value comes back to a non-alarm value (see hysteresis setting).

Example 2 (MI CT)
(no connection between terminals Z1, Y1 or 8, 9 - latch function disabled)

The relay operates when the current flowing in the CT exceeds (or drops below) the set level for more than the set delay time.
It releases when the current drops below (or exceeds) the set level (see hysteresis setting) or when power supply is interrupted.

Example 3 (MP CT)
(no connection between terminals Z1, Y1 or 8, 9 - latch function disabled - over current measurement)
The relay operates when the maximum current flowing in the CT exceeds the set level for more than the set delay time.
It releases when the maximum current drops below the set level (see hysteresis setting) or when power supply is interrupted.

Note
When the inhibit contact is opened, if the input signal is already in alarm position, the delay time needs to elapse before relay activation.

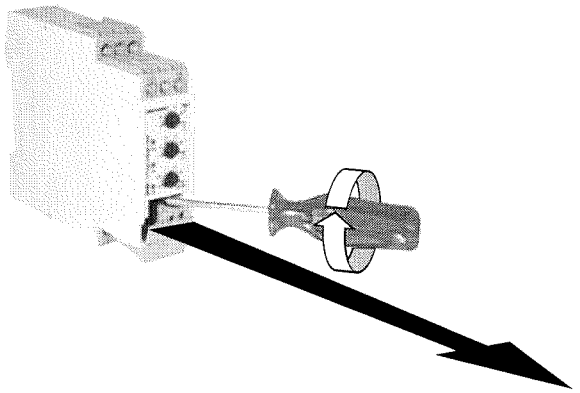
Specifications are subject to change without notice (27.02.04)

CARLO GAVAZZI

Function/Range/Level and Time Delay Setting

Adjust the measuring range setting the DIP switches 1 and 2 and select the desired function setting the DIP switches 3 to 6 as shown below.

To access the DIP switches open the grey plastic cover as shown below.



Selection of level and time delay:

Upper knob:
Setting of hysteresis on relative scale: 0 to 30% on set value.

Centre knob:
Current level setting on relative scale: 10 to 110% on full scale.

Lower knob:
Setting of delay on alarm time on absolute scale (0.1 to 30 s).

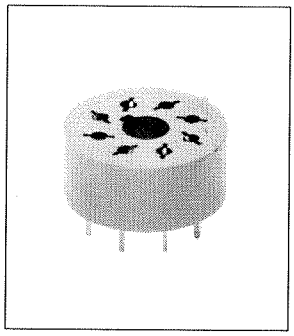
Types S, D, ZPD, ZVD

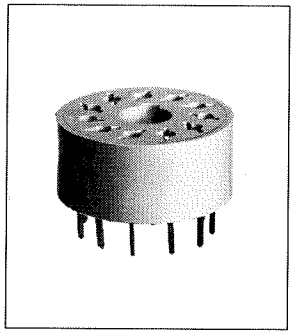
CARLO GAVAZZI

Socket types S 008, S 011
For mounting on printed circuits.

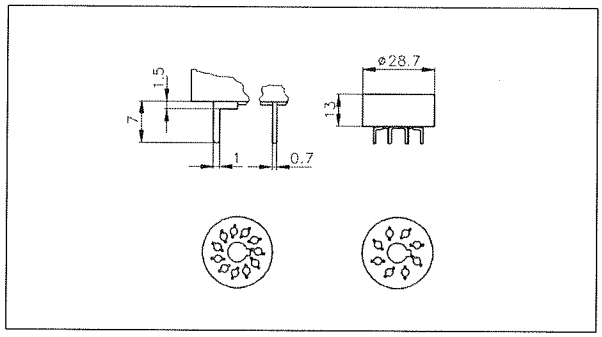
S 008
8-pole circular socket.

S 011
11-pole circular socket.





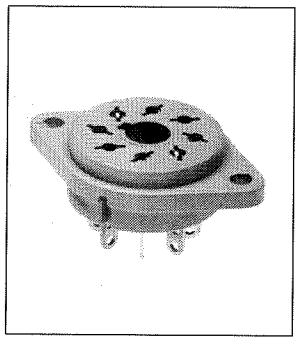
Material	Glasfilled Noryl SE 1
Colour	Light grey
Material of spring	Tin-plated brass
Printed circuit hole diameter	Min. 1.5 mm
Approvals	UL, CSA, SEV

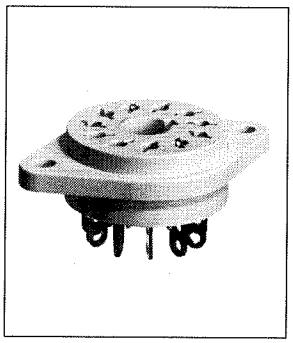


Socket types S 108, S 111
For mounting on or below a chassis with soldering and plug connections (AMP 187).

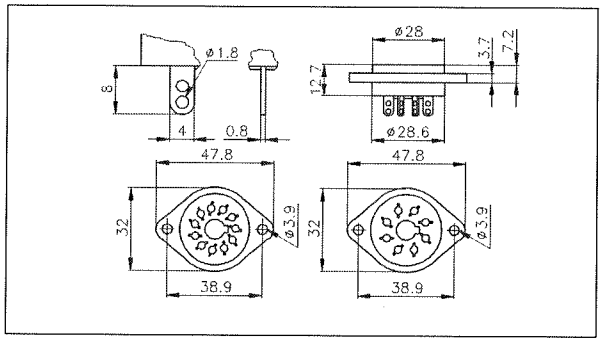
S 108
8-pole circular socket.

S 111
11-pole circular socket.





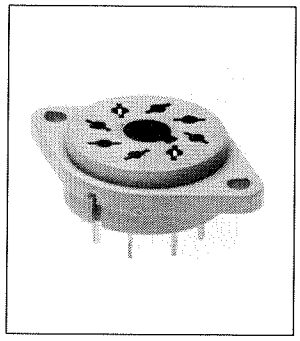
Material	Glasfilled Noryl SE 1
Colour	Light grey
Material of spring	Tin-plated brass
Approvals	UL, CSA, SEV

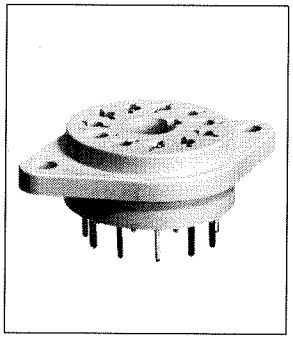


Socket types S 108 A, S 111 A
For mounting on or below a chassis or printed circuits.

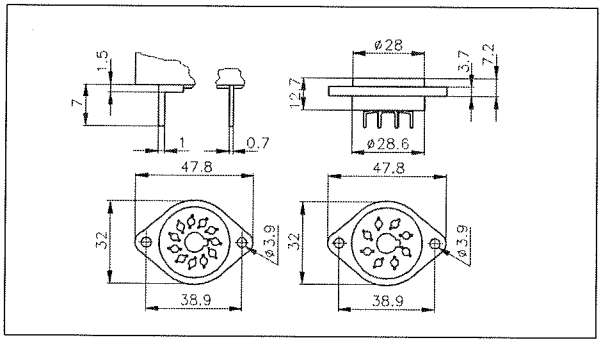
S 108 A
8-pole circular socket.

S 111 A
11-pole circular socket.





Material	Glasfilled Noryl SE 1
Colour	Light grey
Material of spring	Tin-plated brass
Approvals	UL, CSA, SEV



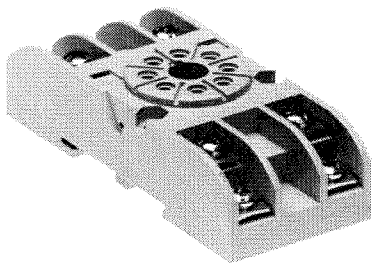
CARLO GAVAZZI

Sockets (cont.)

Socket types S 408, S 411
Socket with front screw connections. For mounting by two front screws or for snap-mounting on DIN-rail (DIN EN 50 022). With captive cable clamps and cross-cut terminal screws. For devices with circular plugs.
Text markers, type no. tags: e.g. Weidmüller type SG 10

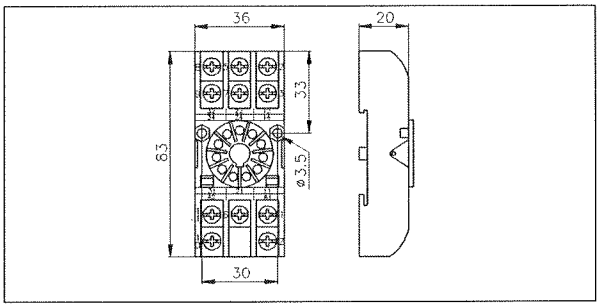
S 408
8-pole circular socket.

S 411
11-pole circular socket.



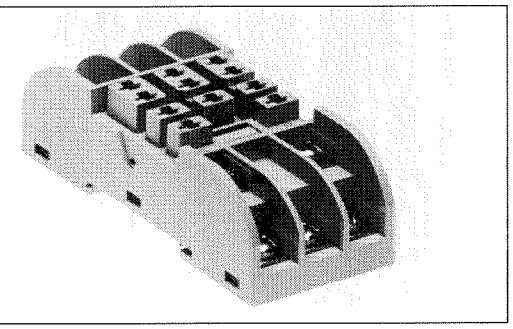
S 408

Rating	10 A/250 VAC (IEC 664)
Installation/pollution deg.	Cat. III/2
Degree of protection	IP 10 (IEC 529)
Material	
Socket	Light grey, Noryl SE1
Contact spring	Tin-plated brass
DIN-rail retaining spring	Stainless steel wire
Approvals	UL, CSA, SEV

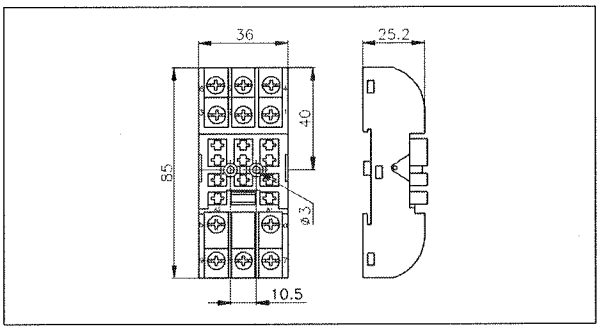


Socket type D 411 B
Socket with front screw connections. For mounting by two front screws or for snap-mounting on DIN-rail (DIN EN 50 022). With captive cable clamps and cross-cut terminal screws. For devices with spade plugs (4.8 x 0.5 mm).
Text markers, type no. tags: e.g. Weidmüller type SG 10

D 411 B
11-pole spade socket.



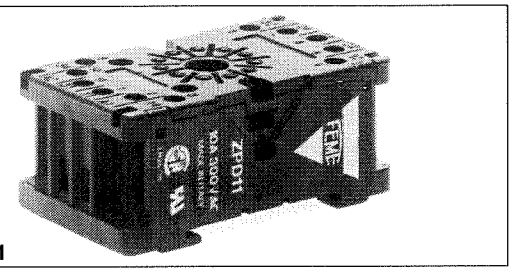
Rating	10 A/250 VAC (IEC 664)
Installation/pollution deg.	Cat. III/3
Degree of protection	IP 10 (IEC 529)
Material	
Socket	Black, Noryl SE1
Contact spring	Tin-plated brass
DIN-rail retaining spring	Stainless steel wire
Approvals	UL, CSA, SEV



Socket types ZPD 8, ZPD 11,
Socket for mounting on DIN-rail (DIN EN 50 022).
Text markers, type no. tags: e.g. Weidmüller type SG 10

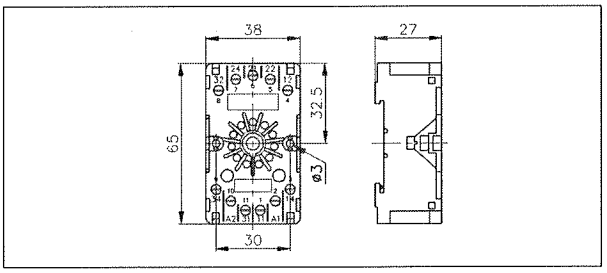
ZPD 8
8-pole circular socket.

ZPD 11
11-pole circular socket.



ZPD 11

Rating	10 A/300 VAC (IEC 664)
Installation/pollution deg.	Cat. III/2
Degree of protection	IP 20 (IEC 529)
Material: Socket	Black, thermoplast. resin (UL 9040 HB)
Contact spring	Nickel-plated copper alloy
DIN-rail retaining spring	Stainless steel wire
Approvals	UL, CSA



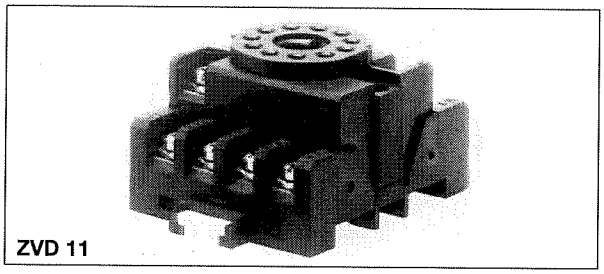
Specifications are subject to change without notice

CARLO GAVAZZI

Sockets (cont.)

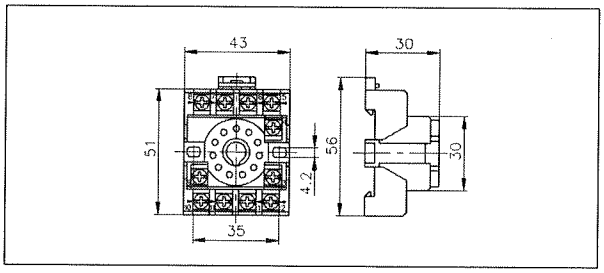
Socket types ZVD 8, ZVD 11,
Socket for mounting on DIN-rail (DIN EN 50 022).

ZVD 8	8-pole circular socket.
ZVD 11	11-pole circular socket.



ZVD 11

Rating	10 A/300 VAC (IEC 60664)
Installation/pollution deg.	Cat. III/2
Degree of protection	IP 10 (IEC 60529)
Material - Socket	Black, thermoplast. resin (UL 94 V-1)
Contact spring	Nickel-plated copper alloy
DIN-rail retaining spring	Polyester



SAFEBLOC Acier - 40 à 1600 A
Steel sheet SAFEBLOC - 40 to 1600 A

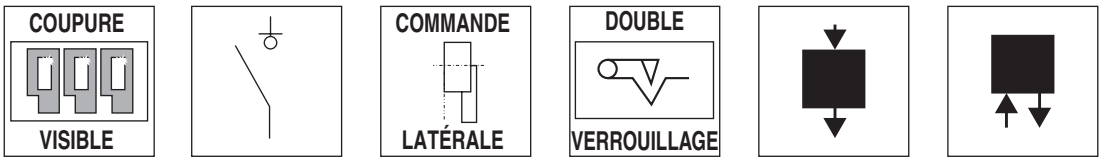
COUPURE VISIBLE
VISIBLE BREAKING

VISION DES COUTEAUX
INTERRUPTEUR OUVERT
VISION OF CONTACTS
WHEN SWITCH IS OPEN

Coffret équipé d'un interrupteur IM 40 A 3 pôles. Raccordement B/B.
Enclosure equipped with switch IM 40 A 3 phases. Down/down connection.

- Particulièrement reconnu pour sa solidité en milieu industriel.

- Especially appreciated for its robustness in industrial environment.



Visible breaking — *Lateral handle* — *With double safety interlock*

CEFEM Zone artisanale la Chapelle • FRANCE • 07200 St-Michel-de-Boulogne
Tél. : 33 4 75 87 12 46 • Fax : 33 4 75 87 11 70 • Site : http://www.cefem.fr • e-mail : cefem@cefem.fr

APPLICATIONS

Installation :
intérieure et extérieure.

Domaines d'utilisation :
l'industrie lourde (mines, carrières, sucreries, cimenteries, papeteries, sidérurgie,…).

Avantages de la gamme :
avec son enveloppe très robuste réalisée en acier ép. 2 mm, monobloc, entièrement soudée. Cette gamme de par sa conception allie robustesse, fiabilité et fonctionnalité.

CARACTÉRISTIQUES

Interrupteurs sectionneurs :
IM de 40 à 1600 A à commande latérale droite et coupure visible.

Poignée de manœuvre :
latérale isolante, couleur rouge, cadenassable par 3 cadenas en position circuit « ouvert » et indémontable de l'extérieur.

Raccordements :
Haut/Bas ou Bas/Bas avec précâblage des bornes amont par jeu de barres à partir de 160 A.

Double verrouillage de porte :
avec impossibilité d'ouvrir la porte lorsque l'interrupteur est fermé et impossibilité de fermer l'interrupteur lorsque la porte est ouverte.

Coupure visible :
au travers d'une fenêtre en verre Triplex de 6 mm d'épaisseur et indémontable de l'extérieur.

Fermeture :
par serrure triangulaire de 7 mm (autre sur demande).

Enveloppe :
- enveloppe en tôle acier électrozinguée ép. 2 mm,
- **INOX 316 L sur demande**,
- peinture époxy ep 70 microns ± 5, de couleur gris clair RAL 7035,
- toit de protection incliné dépassant de 35 mm,
- porte montée sur charnières en Zamak chromé et broche inox, autorisant une ouverture à gauche de 180°,
- ensemble coffret IP 55,
- plaque de fond passes câbles en acier ép. 2 mm peint RAL 7035,
- résistance à la température : - 40° à + 130°C,
- résistance aux chocs IK10 : 20 joules,
- fixation murale par 4 pattes de fixation acier soudées au coffret.

Mise à la terre :
un boulon de mise à la terre extérieur soudé sur le coffret. Deux points de mise à la terre à l'intérieur des coffrets. Une tresse de masse en cuivre étamé réalise la liaison de masse entre la porte et le coffret.

APPLICATIONS

Installation:
inside and outside.

Main uses:
heavy industry (mines, quarries, sugar, cement, paper, iron and steel,…).

Benefits:
very solid enclosure made at once with 2 mm thick steel, all welded. This range, through its design, matches reliability, commodity and robustness requirements.

CHARACTERISTICS

Load-break switches:
IM from 40 to 1600 A with right lateral handle and visible breaking.

Handle:
lateral operated, isolating, red, lockable with 3 locks on "open" position, can not be unfixed from the outside.

Connexions:
up/down or down/down with pre-cabling of upper terminals using connexion bars from 160 A.

Double safety interlock:
impossible to open the door when switch is "on" and impossible to turn on the switch when door is open.

Visible breaking:
through window protected by 6 mm thick Triplex glass, can not be unfixed from the outside.

Locking:
using 7 mm triangular lock (other possibilities on request).

Enclosure:
- *2 mm thick steel sheet,*
- ***INOX 316 L on request**,*
- *epoxy paint thickness 70 microns ± 5, colour : bright grey RAL 7035,*
- *35 mm.protruding leaning roof to avoid water and dust ingress,*
- *door fixed on Zamak stainless steel hinges, with 180° opening on left side,*
- *IP 55 overall protection,*
- *removable bottom plate for cable glands, 2 mm thick, aluminium made, RAL 7035 painted,*
- *temperature resistant: - 40° up to + 130°C,*
- *chocks resistant: IK10: 20 joules,*
- *wall fixing using 4 welded fixations.*

Earth connexion:
an earth connexion is welded on the enclosure. 2 earth connexions inside the enclosure. An earting copper braid is connecting the enclosure and its door.

0 Foreword

CE

You have purchased a Mannesmann Dematic product. This equipment was manufactured in accordance with state-of-the-art engineering principles.

These operating instructions are designed to provide the operator with appropriate instructions for safe and correct operation and to facilitate maintenance.

Every individual given the task of transporting, installing, commissioning, operating, maintaining and repairing our geared motors and additional equipment must have read and understood

- the operating instructions
- the safety regulations and
- safety instructions in the individual chapters and sections.

The operating instructions must be available to the operating personnel at all times in order to prevent operating errors and to ensure smooth and trouble-free operation of our products.

0.1 Copyright

These operating instructions must be treated confidentially. They should only be used by authorized personnel. They may only be entrusted or made available to third parties with the prior written consent of Mannesmann Dematic. All documents are protected within the sense of copyright law.

No part of this documentation may be reproduced, utilized or transmitted without specific prior consent. Infringements are an offence resulting in obligatory compensatory damages. All industrial rights reserved.

0.2 After-sales service

For technical information on Mannesmann Dematic products and their systematic application, please refer to one of our after-sales service stations, the relevant representative or to our main office in Wetter.

0.3 Guarantee

These operating instructions must be read carefully before installing and putting the product into operation.

We assume no liability for damage and malfunctions resulting from failure to comply with the operating instructions.

Wearing parts are not subject to the guarantee, guarantee claims must be made by quoting the order number to Mannesmann Dematic immediately on detecting the defect.

The guarantee is cancelled, for example, in the event of:

- inappropriate use,
- faulty devices or equipment connected or attached to the product which are not part of our scope of supplies and services,
- use of non-genuine spare parts and accessories,
- refurbishment or modification of the product unless approved in writing by Mannesmann Dematic.

0.4 Liability

All technical information, data and instructions for operation contained in these operating instructions were up-to-date on going to print and are compiled on the basis of our experience and to the best of our knowledge.

We reserve the right to incorporate technical modifications within the scope of further development of the geared motors which are the subject of these operating instructions.
Therefore, no claims can be derived from the information, illustrations and descriptions contained in these operating instructions.

The descriptions and illustrations contained in this documentation do not necessarily correspond to the scope of delivery or any subsequent spare part delivery, either; the drawings and illustrations are not to scale.
Only documentation belonging to the actual order is valid.

We assume no liability for damage and malfunctions caused as a result of operating errors, noncompliance with these operating instructions or inappropriate repairs and maintenance.
We expressly point out that only Mannesmann Dematic spare parts and accessories approved by us may be used.

Accordingly, this also applies to other manufacturers' parts used.
For safety reasons, the fitting and use of spare parts or accessories which have not been approved and unauthorized modification and conversion of the product are not permitted and exempt Mannesmann Dematic from any liability for damages resulting therefrom.

With the exclusion of any further claims, Mannesmann Dematic is liable for any faults or omissions on our part within the scope of the warranty obligations entered into in the original contract. Claims for damages – except for legal claims resulting from product liability legislation – are excluded, irrespective of the legal reason from which such claims are derived.

0.5 Definitions

Owner

Owners (employer, company) are defined as persons who own the product and who use it appropriately or allow it to be operated by suitable persons.

Operating personnel

Operating personnel are defined as persons assigned by the owner of the product to carry out special tasks such as installation, operation, setting-up, maintenance including cleaning, fault elimination and transportation of the product.

Specialist personnel

Specialist personnel are defined as persons assigned by the owner to carry out specific tasks.

- **ualified personnel**

  Qualified personnel are defined as persons, who, owing to their technical training, knowledge and experience as well as knowledge of the relevant standards, are able to assess the tasks given to them and identify potential hazards.

- **Trained person**

  Trained persons are defined as persons who have been instructed and trained for the tasks assigned to them and on the possible hazards resulting from incorrect handling and who have been informed about the required protective devices, protective measures, relevant regulations, codes of practice, accident prevention regulations and operating conditions and who have proven their qualifications.

- **Experienced technician**
  Experienced technicians are defined as persons, who, owing to their technical training and experience, have sufficient knowledge of the product and are familiar with the relevant national industrial safety regulations, codes of practice, accident prevention regulations, directives and generally accepted engineering standards (e.g. EC Directives, German VDE and VBG regulations) enabling them to judge the safe operating condition of geared motors.

1 Safety

1.1 Symbols

The following symbols and recommendations indicate potential safety hazards or causes of damage or provide useful information.

a ard warning

This symbol appears in the operating instructions next to all instructions relating to safety at work wherever a potential hazard to life and limb exists if the instructions are not complied with.

Follow these instructions at all times and be particularly careful and cautious.

Pass on safety instructions to all persons entrusted with working on geared motors including the power supply.

In addition to the safety instructions, observe all general safety regulations and codes of practise at all times.

Warning against electrical ha ards

Contact with live parts can result in immediate death. Protective covers (e.g. covers and enclosures) marked with this sign may only be opened by qualified electricians. Before opening, all relevant operating, control, feed or other voltages must be disconnected.

Operating ha ard for the installation

This symbol in the operating instructions indicates all warnings which, if not complied with, may result in damage to geared motors.

1.2 Intended use

Geared motors are intended for all travel, lifting and turning motions in industrial applications. Compliance with the permitted operating conditions must be ensured for operation of these drives (e.g. enclosure type, ambient temperature, installation height).

1.3 Prohibited practises, improper use

Under certain conditions, operation of geared motors is prohibited as this could result in malfunctions, faults in the equipment or hazard to life and limb, e.g.:

- Acidic, corrosive air as coolant
- Operation outside the permitted temperature range
- Operation beyond the normal air pressure. Otherwise, power adjustments are necessary
- Operation under conditions of high humidity or splashwater
- Manipulation of electrical modules

Safety devices must not be rendered inoperable or modified or used in any way other than that for which they have been designed.

214206k1.p65/0999

1.4 Safety instructions

The relevant national accident prevention regulations and the general safety conditions must always be observed when our products are operated in order to avoid accidents and damage to machinery. If the safety instructions given in these operating instructions are not observed in any way, personal injury or even death can result.

Dangerous voltage.

Geared motors are connected to a mains power supply. Any contact with live parts can lead to very serious injury or even death.

Putting offset geared motors into operation

Do this only

- if you have read the operating instructions and the owner has instructed you in all details,
- if the operating instructions are available for reference at the place of operation,
- if you are qualified personnel,
- if you are not under the influence of drugs, alcohol or medication that can adversely affect your ability to react,
- if the general accident prevention, operating and installation regulations (e.g. DIN-VDE 0100/0113/0160) have been observed.

Additional safety instructions

Only carry out maintenance and installation work

- if you are qualified specialist personnel,
- if the motors are at zero voltage,
- if no hazard exists (e.g. crushing hazard, slipping hazard, etc.),
- if the motors are secured against restoration of the power supply,
- if all cables and motor terminals are at zero potential (establish with a voltmeter),
- with insulated tools,
- using genuine spare parts.

2 Receiving, transport and storage

2.1 Receiving

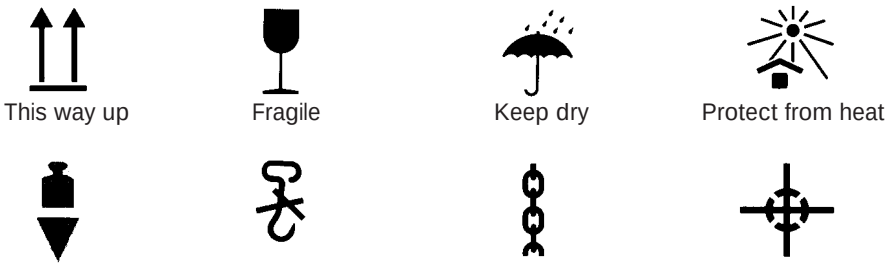
The scope of delivery is specified in the shipping papers. Check the delivery immediately on receipt to ensure that it is complete and examine it for damage caused in transit. If necessary, a damage report must be made out in the presence of the transport contractor's representative as otherwise it will not be possible to rectify the damage at no cost to you.

2.2 Transport

The drive is supplied made up into one unit. Additional equipment may be supplied in separate packaging.

The drive is packed depending on the transport method and its weight. Unless otherwise agreed in the purchase contract, the packaging corresponds to the packaging guidelines of Mannesmann Dematic AG.

Symbols used on the packing



Handle geared motors with utmost care to avoid damage caused by careless loading and unloading, for example.

2.3 Storage

Geared motors must be stored as follows:

- in dry places with low temperature fluctuations
- in the same position as for operation
- protected against dust and moisture
- on a wooden support
- free from vibration (no impacts)

Drives must not be stacked on top of each other.

Unless otherwise agreed in the purchase contract, standard conservation is guaranteed for a period of 6 months. The guarantee period begins on the day the unit is delivered.

Contact Mannesmann Dematic AG in Wetter, Germany, if geared motors are to be stored for periods of longer than 6 months.

Important Geared motor units may otherwise be damaged.

214206k1.p65/0999

3 Product description

3.1 Gearbox

Demag offset geared motors offer the optimum solution for space-saving requirements owing to their compact design. The variety of drive shafts – hollow or solid shaft – and the possible mounting variants as a hollow-shaft geared motor of torque bracket, foot or flange-mounted design make it possible to implement cost-effective solutions for the given drive requirement.

For these reasons, the offset geared motor design is used for travel drive applications all over the world.

The range includes 9 gearbox sizes. Sizes A10 to A40 feature a dimensionally stable, vertically split housing of high quality pressure die-cast aluminium alloy. This guarantees high stability for high performance and low dead weight.

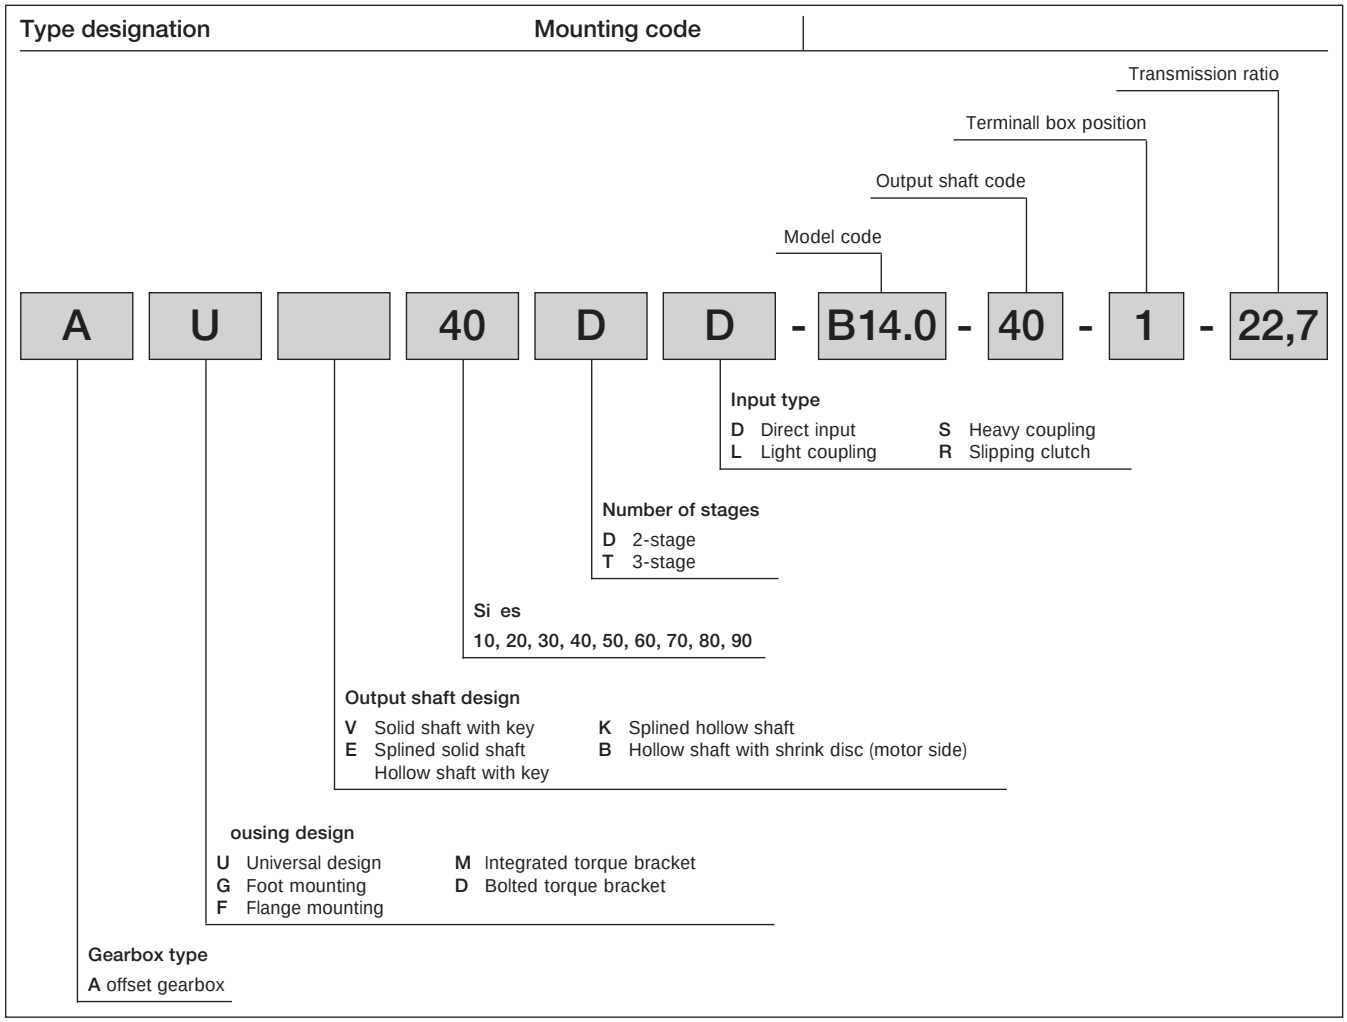
Sizes A50 to A90 feature a grey cast iron housing. Size A10 is of two-stage design, sizes A20 to A90 are two or three-stage depending on the transmission ratio.

3.1.1 Motor to gearbox connection

The motor either drives the gearbox via a **direct drive input** or **coupling** connection.

- **Direct drive input** means that the motor is flanged to the gearbox.
- The **coupling** connection means that the motor is bolted to the coupling enclosure of the gearbox and drives the gearbox via a coupling. Couplings are available in various designs. The various model types are coded by a letter for the drive input connection in the “Type” line on the gearbox rating plate (see section 3.1.3).

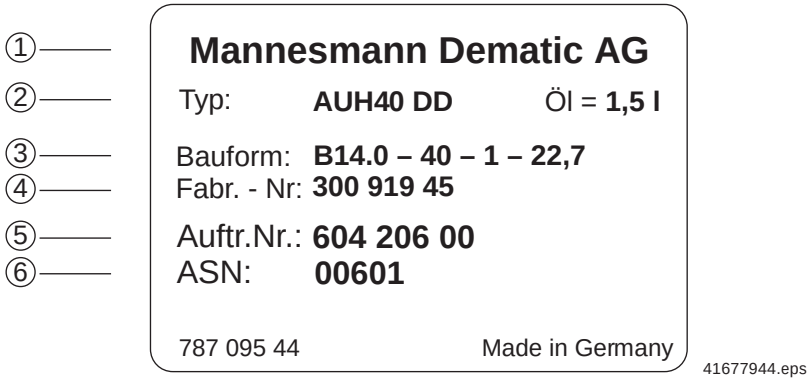
3.1.2 Gearbox type designation



3.1.3 Gearbox rating plate

All gearbox features can be found in the form of a model code on the gearbox rating plate.

See the legend for the example below:



① **Manufacturer**

② **Type**

AU	Gearbox type designation	
40	Size	
D	Number of stages	
D	Input design	“Direct input”
L	Input design	“Coupling, light”
S	Input design	“Coupling, heavy”
R	Input design	“Slipping clutch”

Oil Lubricant and quantify

③ **Model**

B14.0	Model and position
40	Output shaft code
1	Terminal box position
22,7	Transmission ratio

④ **Serial number**

⑤ **Order number**

⑥ **Entry number**

Notes:

- The rating plate is attached to the side of the gearbox housing.
- The type and model code are necessary for general questions concerning the housing, mounting position, transmission ratio, etc. For more detailed information on the drive, e.g. for spare parts, the order, serial and entry number (ASN) are required.

3.2 Motor

Demag type Z cylindrical rotor motors can be supplied with or without brake (ZB and ZN motors). The motor range includes frame sizes Z..63 to Z..225. The output ratings of the 2, 4, 6 and 8-pole motors are graded according to the IEC classification. The motor range includes pole-changing designs and motors with integrated fly wheels for particularly smooth load movement.

The housings of motor frame sizes Z..63 to Z..132 are of a high quality aluminium alloy with an integrated terminal box base. The terminal box cover and fan cover are made of plastic.

Motor frame sizes Z..160 to Z..225 have a grey cast iron housing with a fitted terminal box.

3.3 B.. motor brake

Demag B004 to B680 disk brakes are spring-actuated brakes featuring electromagnetic brake release. The brake fitted under the fan cover can be controlled independently of the motor and causes no axial movement of the rotor shaft or forces on the bearings.

The diagram shows the function elements of the disk brake, which operates is spring-actuated with electromagnetic release. When the voltage supply to the brake coil is interrupted, the brake is applied. This operating principle is also known as a fail-safe brake.

Brakes B004 to B680 can be released by a rectifier integrated in the terminal box of the motor or by applying DC voltage direct to the brake coil.

Two brake sizes are available for each motor frame size to cover a large brake torque range for various applications.

B004 – B680 DC brakes

4 Installation

4.1 Transport

Use the lifting eyes provided for transport purposes.

4.2 Checking the condition of the motor

Before installing the motor, check whether it has suffered any damage during transportation or while in storage, such as corrosion, leaks, deformation or breakage.

Do not clean drives with compressed air.

4.3 Checking the installation site

The standard drive is suitable for operation in normal industrial conditions. If the ambient temperature, atmosphere or humidity are other than indicated on the rating plate, the geared motor unit must only be operated with special equipment or features (see rating plate).

Ambient temperature	**from –10 C to 40 C**
Installation height	**up to 1000 m above sea level**

The site at which the geared motor is installed must be designed in such a way that

- air may circulate to allow heat to be exchanged,
- no residue from operating processes can accumulate on the geared motor, fall between the drive elements or damage the sealing ring,
- the oil inlet and outlet and rating plate are accessible.

4.4 Installing the offset geared motor

Before installing the geared motor, check that it will be operated in the mounting position specified on the rating plate. The quantity of oil depends on the mounting position.

Gearbox si es A10 - A40

These gearbox sizes are not vented.

If the gearbox has to be vented (breather screw or valve) – non-standard design – the oil fill screw at the highest point of the gearbox must be replaced by the breather screw or valve.

For arrangement see section 4.4.1, table 2.

For tightening torque see section 6.3, table 11.

Gearbox si es A50 - A90

A breather valve is supplied as standard. This must be fitted at the highest point of the gearbox in place of the oil fill screw.

For arrangement see section 4.4.1, table 2.

For tightening torque see section 6.3, table 11.

Note The breather screw or valve is enclosed together with the operating instructions and parts lists separate from the delivery.

4.4.1 uantity of lubricant dependent on si e and model code mounting position

4.4.2 Mounting position of offset geared motors with solid shaft

The support or flange surface must be designed in such a way that no forces are transmitted to the gearbox housing as a result of mounting distortions. The following conditions must be satisfied by the bolted connections to the supporting structure to ensure correct functioning of the offset geared motor unit:

Table 3

Tightening torques for foot mounting

[1] optional

Flanges:

Centre edge tolerance to DIN 42948

- ISO j6 for b1 ≤ 230 mm
- ISO h6 for b1 > 230 mm

The drive shaft must be carefully cleaned to remove the corrosion protection before drive elements such as clutches, chain sprockets, gear wheels or belt pulleys are fitted.

Ensure the cleaning agent used will not damage the sealing ring.

Drive elements may only be fitted or removed with suitable devices, using a centre bore hole to DIN 332 in the journal shaft, if required. It is advisable to heat the hub to approx. 100° C.

The drive element must fixed on the shaft in the position specified for the drive arrangement. The manufacturer's recommendations relating to pretension settings and maintenance must be complied with in the case of chains and wheels.

4.4.3 Fitting offset geared motors with hollow shaft, key or splined profile shaft

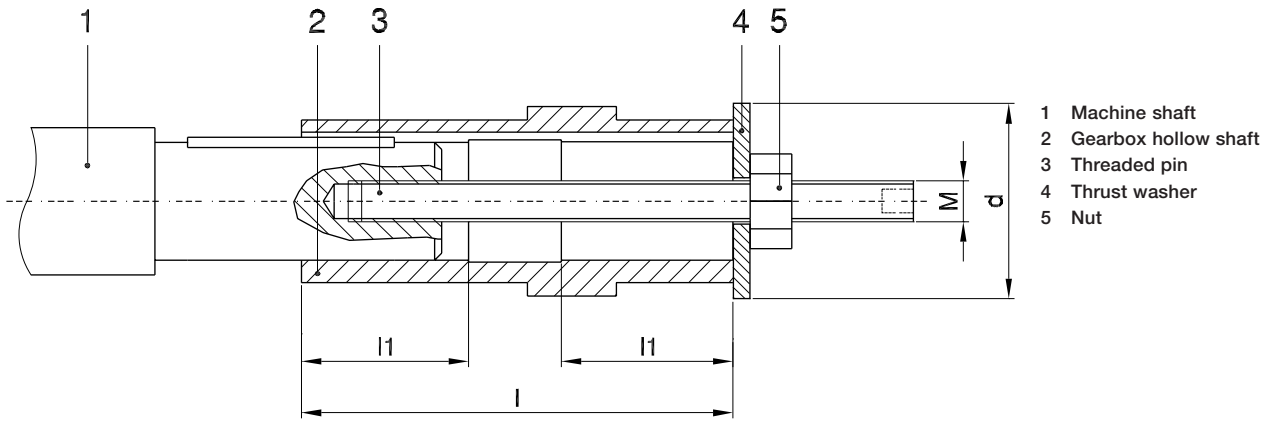
Before fitting the geared motor unit, ensure the machine shaft and the hollow shaft of the gearbox are undamaged and free of burrs and foreign particles. The machine shaft must feature a centre bore hole with a thread to DIN 332 and be lubricated with a commercially available lubricant.

Fitting the offset geared motor

- The offset geared motor must be fitted using the threaded pin and relevant thrust washer as indicated in the “Fitting dimensions” overview.
- The machine shaft must be guided on both sides in the hollow shaft.

Fitting with threaded pin

Fitting arrangement diagram



The scope of delivery does not include the threaded pin and thrust washer

4 2-part outer section
5 Threaded section
6 Spindle

41677544.eps

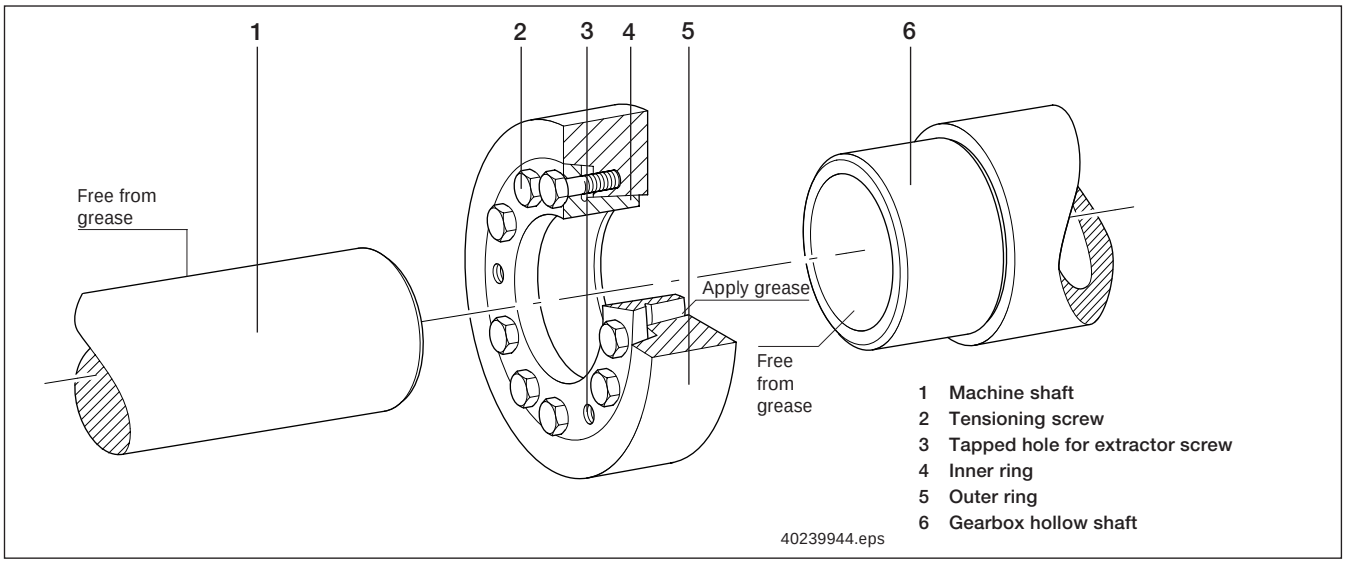
It may be assumed that splined shaft connections are easier to disconnect than shaft connections with a key.

4.4.4 Fitting offset geared motors with hollow shaft and shrink disk connection

ollow shaft with shrink disk connection

The same procedure applies for fitting the gearbox on the machine shaft as for splined profile shafts and hollow shafts with key.

Fitting and removing the shrink disk connection



General

As standard, the shrink disk is fitted to the hollow shaft of the gearbox and only lightly tightened for transport.

Fitting

1. Before the gearbox is placed on the mating shaft, the inside of the hollow shaft and the outside of the mating shaft must be degreased using a solvent.
2. Release the tension in the shrink disk by unscrewing all tensioning screws a few turns anticlockwise, and slide the gearbox, together with the shrink disk, onto the mating shaft and position them. Slide the shrink disk inner ring up to the stop on the hollow shaft.
3. Tighten all tensioning screws. It will be necessary to go round the pitch circle several times until all the front faces of the outer and inner rings are flush. The correct tightness of the HSD shrink disk can be easily checked at any time, since when correctly fitted, the front faces of the outer and inner rings must be flush.

Removal

1. Loosen all tensioning screws by unscrewing them anticlockwise. If necessary, the outer ring can be released from the inner ring by tightening screws in the tapped holes provided. The tensioning screws can be used for this purpose.
2. Any rust which may have formed on the mating shaft in front of the hollow shaft must be removed.
3. Remove the gearbox from the mating shaft.

Cleaning and lubrication

Shrink disks which have been removed do not need to be disassembled and relubricated before they are fitted again.

Shrink disks must only be cleaned and relubricated if they are dirty.

One of the following solid lubricants should be used for the conical surfaces.

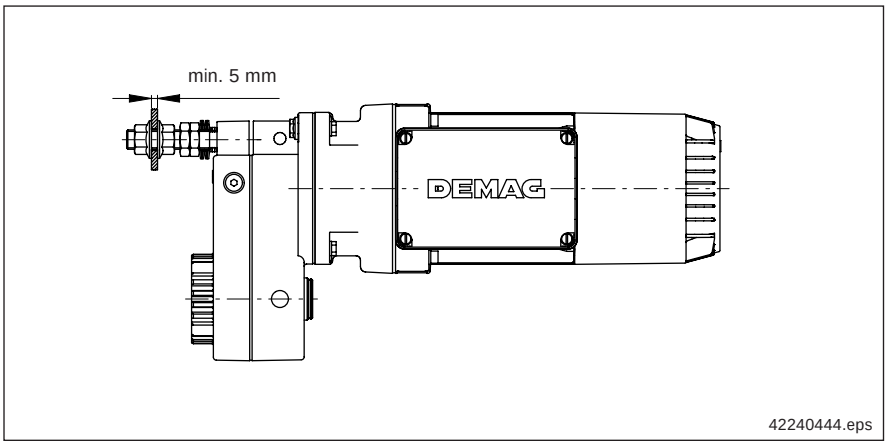
Table 6

Commercially available lubricants with high MoS2 content	
Molykote 321 R (lubricating varnish) Part no. 972 398 44	Spray
Molykote Spray (powder spray)	Spray
Molykote G Rapid	Spray or paste

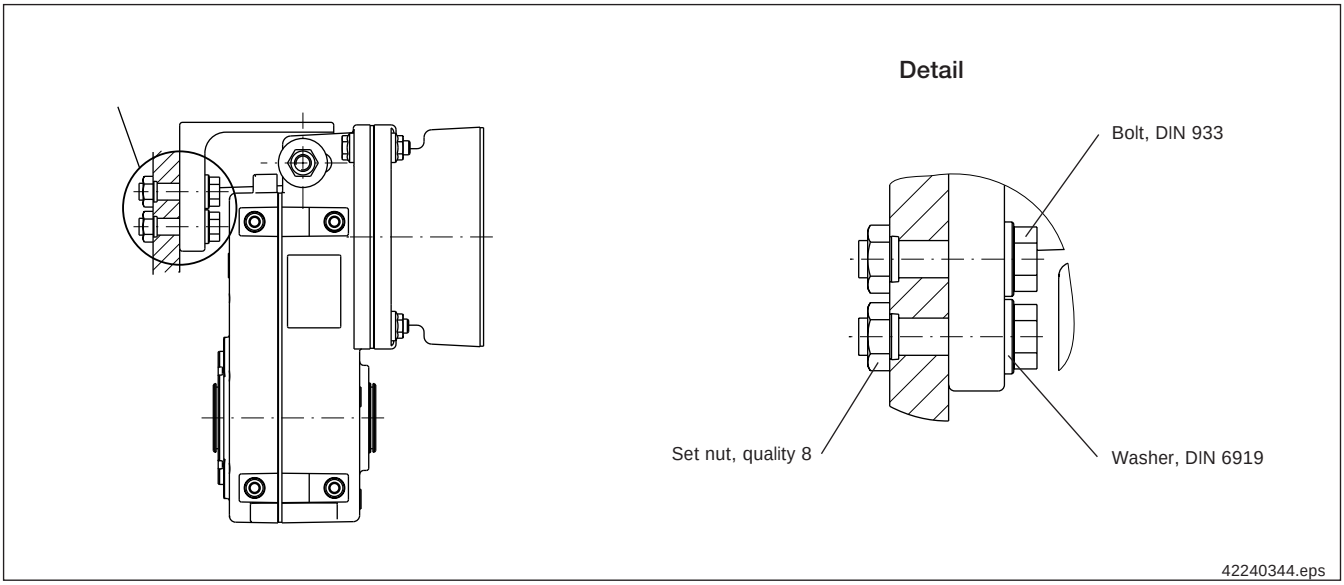
4.4.5 Torque bracket connection

4.4.5.1 D2 torque bracket for AM10

The torque bracket is inserted into the opening in the gearbox housing and compressed to retain it in the opening by tightening a nut.



4.4.5.2 Torque bracket AM20, AU20 30, AU AD40, AU AD50



4.4.5.3 Torque bracket, tightening torques

Table 7	Gearbox si e	Support structure - torque bracket			Gearbox - torque bracket	
		Si e	uantity	Tightening torque Nm	Si e	Tightening torque Nm
	AM10	M16	1	200	M16	14
	AU20	M12	2	115	M12	50
	AU30	M12	4	115	M12	100
	AU AD40	M12	4	115	M12	100
	AU AD50	M16	4	300	M16	200

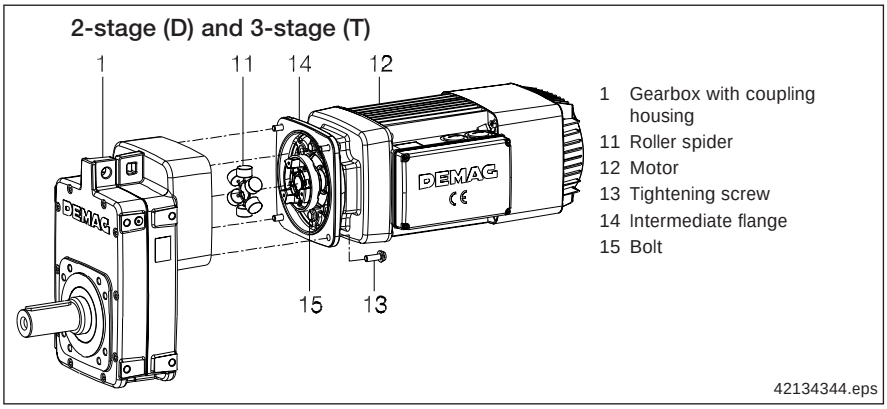
The paint finish thickness between the torque bracket and connecting surface must not exceed 60 m.

4.5 Assembling, disassembling the motor and gearbox

It is important to establish whether the geared motor was supplied with a coupling or direct input connection for assembling/disassembling the motor.

The gearbox type designation can be found on the rating plate (see section 3.1.3).

4.5.1 Coupling connection A10 to A60



Disassembly

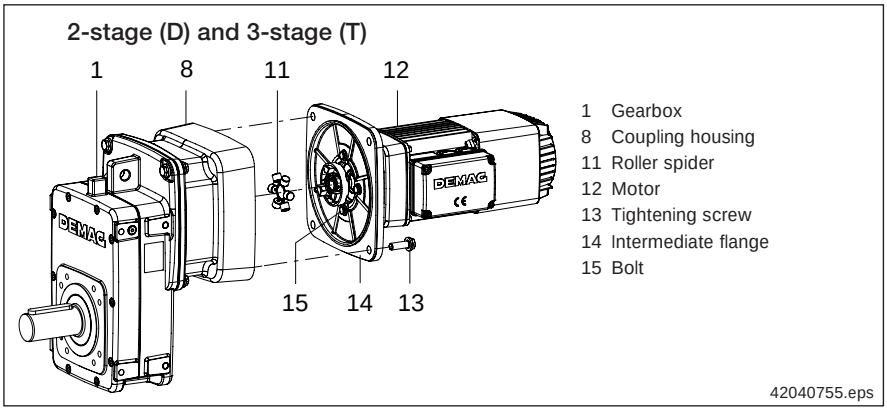
1) Undo the 4 connecting screws (13).
2) Remove motor (12) from coupling (8). Roller spider (11) will lie loose in the coupling half.

Assembly

3) Place roller spider (11) into the gearbox coupling half.
4) Fit motor (12) into coupling (8) and attach using the 4 connecting screws (13).
5) When replacing the motor, undo screws (15) connecting the gearbox to intermediate flange (14) and retighten following replacement of the motor.

For tightening torques see table 8.

4.5.2 Coupling connection A70 to A90



Disassembly

1) Undo the 4 connecting screws (13).
2) Remove motor (12) from coupling (8). Roller spider (11) will lie loose in the coupling half.

Assembly

3) Place roller spider (11) into the gearbox coupling half.
4) Fit motor (12) into coupling (8) and attach using the 4 connecting screws (13).
5) When replacing the motor, undo screws (15) connecting the gearbox to intermediate flange (14) and retighten following replacement of the motor.

For tightening torques see table 8.

214206k2.p65/0999

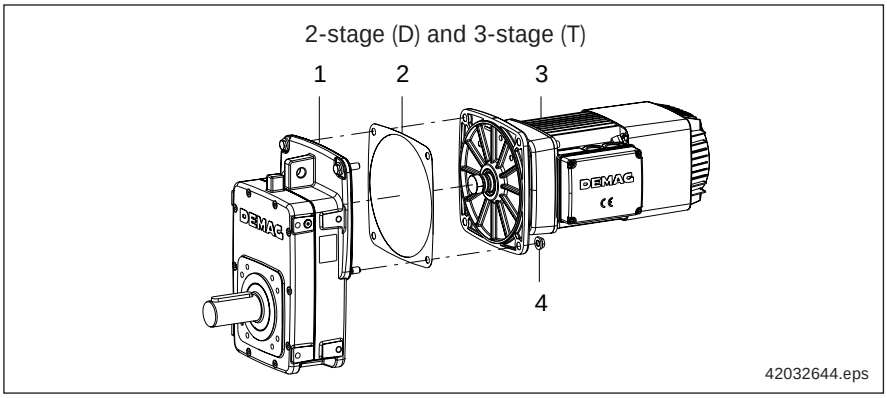
4.5.3 Direct connection

Gearbox si es A10 – A 50



Disassembly

1) Drain the oil (see section 6.3).
2) Undo connecting screws/nuts (4).
3) Remove motor (3).
4) Remove seal (2) and clean the sealing surface.

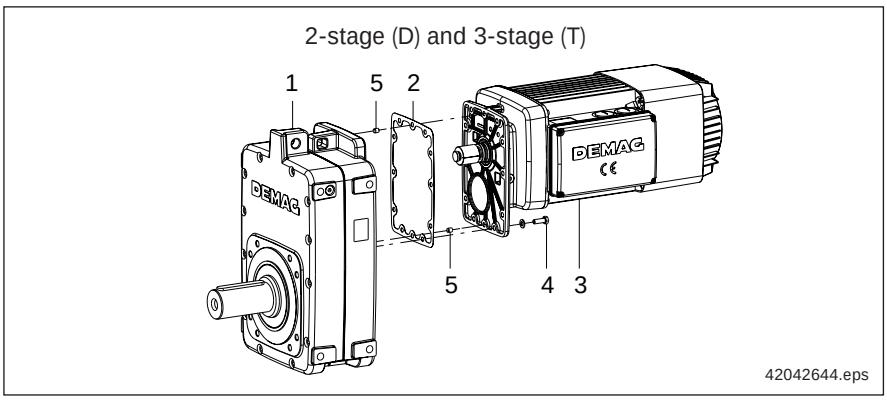
Assembly

5) Place seal (2) on gearbox sealing surface. Fit motor (3) to gearbox (1). Tighten connecting screws/nuts (4).

For tightening torque see table 9.

6) Fill with oil (see sections 4.4.1 and 6.3).
7) Put geared motor into operation and check for leaks.

Gearbox si es A60 – A90



Disassembly

1) Drain the oil (see section 6.3).
2) Undo connecting screws/nuts (4)
3) Remove motor (3. Leave centring pin (5) in remaining half.
4) Remove seal (2) and clean the sealing surface.

Assembly

5) Place seal (2) on gearbox sealing surface. Fit motor (8) to gearbox (1). Tighten connecting screws/nuts (5) with washers (4).

For tightening torque see table 9.

6) Fill with oil (see sections 4.4.1 and 6.3).
7) Put geared motor into operation and check for leaks

4.6 Installing the offset geared motor

Before installing the offset geared motor, check that it will be operated in the mounting position specified on the rating plate.

4.7 Special instructions for installing the offset geared motor

If the motor is operated outdoors in vertical mounting position IM V1 or in an inclined mounting position with the shaft facing downwards, it should be protected by a canopy.

For motors with condensation water openings which can be closed with a threaded plug, the drain holes must be arranged at the lowest point of the motor as otherwise water may enter. If the mounting position of the motor is changed and the drain holes are no longer required, the openings must be permanently sealed.

4.8 Requirements for connecting the offset geared motor

- You must be a trained electrician and familiar with the relevant accident prevention regulations and codes of practice.
- The motor and connecting cable must be disconnected from the supply.
- The frequency and voltage specified on the rating plate must correspond to the line frequency and voltage.

The motor must be connected as described in section 7 **Motor brake connection diagrams** .

To change the direction of rotation of the motor, two of the three phase conductors must be interchanged.

The instructions contained in section 5 Commissioning must be followed.

5 Commissioning

5.1 Requirements

Before the drive unit is put into service:

- the terminal box be must be closed,
- the fan cover must be fitted,
- the line voltage and frequency specified on the rating plate must match the given power supply,
- the motor must be checked for correct connection (check direction of rotation),
- heat must be able to dissipate (e.g. air vent slits must be free),
- it must be ensured that the drive unit does not constitute a hazard (e.g. no hazards caused by rotating or live parts),
- it must be ensured that there are no other hazard sources.

5.2 Check when commissioning

Check that:

- the motor runs correctly (e.g. no speed fluctuations or excessive noise),
- no oil escapes from the unit,
- there is no extreme vibration.

6 Maintenance

6.1 Checking before and during operation

If defects or damage are detected, the offset geared motor must not be put into operation or taken out of service. It may only be put back into service when the defect has been eliminated.

	Check		Action
Check the gearbox for	• External damage	→	Inform person responsible
	• Oil leaks	→	Inform person responsible
	• Unusual noises during operation	→	Inform person responsible
	• Dirt accumulation	→	Remove dirt
Check the motor for	• External damage	→	Inform person responsible
	• Unusual noises during operation	→	Inform person responsible
	• Dirt accumulation	→	Remove dirt

6.2 Maintenance schedule

Table 10 Maintenance schedule

Interval	Part	Maintenance	See section
According to operating conditions, at least every 3000 operating hours.	Brake	Check brake of motors fitted with brake.	6.4 or. 6.5
According to operating conditions, at least every 3000 operating hours.	Coupling	Check roller spider or elastic transmission element for play, deformation or initial wear.	3.1.1 or. 4.5.1, 4.5.2
Every 10 000 operating hours.	Motor	Inspect the motor and clean the cooling air channels.	
Every 10 000 operating hours or after 4 years.	Gearbox	Oil change (Under extreme operating conditions, such as increased ambient temperatures or extreme temperature fluctuations, the oil change must be carried out sooner.).	6.3

214206k2.p65/0999

6.3 Gearbox oil lubrication

Gearboxes are filled with lubricant before leaving the factory. The quantity of oil depends on the model and mounting position of the geared motor unit. The quantity of oil is indicated on the rating plate. Standard lubricant is used unless specified otherwise.

Oil grade

A mineral oil to DIN 51 502, CLP 220 is used as standard, e.g.

BP ENERGOL GR- P 220
ESSO Spartan EP 220
S ELL Omala Oil 220
Mobilgear 630
Aral Degol BG 220

Information for re-ordering	
uantity	Part no.
1 l – pack	472 902 44
2,5 l – pack	472 900 44

Oil change intervals

Under normal operating conditions, the lubricant must be replaced every 10000 hours of operation, however at least every 4 years.

Under unusual operating conditions, such as increased ambient temperatures or extreme temperature fluctuations, the oil must be changed sooner.

Checking condition of oil

The oil should only be checked when the gearbox is at operating temperature immediately after switching off to ensure optimum distribution of the oil.

Risk of burning from hot gearbox oil.

- Take an oil sample at the oil drain screw (screw to DIN 908).
- Check the oil (colour, consistency, metal abrasion).
- Change the oil if it is not clean.
- Dispose of drained oil in an environment-friendly manner.

Oil change sequence

Only change the oil when the gearbox is at operating temperature to ensure all the oil is fully drained (cold oil flows poorly).

Risk of burning from hot gearbox oil.

- Place a container below the oil drain screw.
- Remove the oil drain screw and an oil inlet screw.
- Drain all the oil.
  Flush as necessary if the old oil is very dirty (see Flushing).
- Tighten the oil drain screw with a tightening torque according to table 11.
- Fill new oil at oil inlet (oil quantity as specified on the rating plate).
- Tighten the oil inlet screw with a tightening torque according to table 11.

Table11

Tightening torque – oil inlet screw, oil drain screw breather screw, valve		
Gearbox si e	Bolt	Tightening torque Nm
A10 - A50	M10 x 1	5
A60	M12 x 1,5	10
A70 - A90	M16 x 1,5	15

Flushing

If the old oil is particularly contaminated when it is replaced, it is advisable to flush the gearbox before filling it with new oil.

The flushing oil should have a viscosity of 46 – 68 mm²/s at 40° C. The quantity of flushing oil used should be approximately twice that specified for the gearbox. Run the gearbox for a few minutes at no load and then drain the flushing oil. By flushing several times, also with the gearbox running at no load and preferably in alternate directions of rotation, the rest of the old lubricant can be flushed out and drained.

Note

Dispose of drained oil in an environment-friendly manner.

6.4 B004–B680 brakes

The following work may only be carried out by qualified personnel.
Observe relevant safety regulations and codes of practise and the instructions contained in section 1.4 “Safety instructions”.

6.4.1 Measuring the brake displacement

Apart from wear, the brake is virtually maintenance-free. The organic/mineral brake lining is designed in such a way that worn surface particles are only given off as minimal abrasion. This built-in regeneration of the brake lining surface ensures constant braking characteristics. It is advisable to check the brake air gap at certain intervals and to adjust it as necessary to ensure the brake releases reliably. When the brake is released (voltage applied to brake coil), the brake disk can be freely turned.

Guide values for the air gap and brake operation until adjustment are contained in the “Brake settings” tables in section 6.5.

It is only possible to give guide values for brake operation until adjustment as they depend on the given operating conditions.

When the brake has been adjusted several times, the remaining thickness b_{min} of the brake disk must be checked. The guide pins feature an easily visible marking which clearly indicates the minimum dimension. The brake rotor must be replaced when this mark is exceeded. For this purpose, a maintenance and spare part set is available which not only contains the brake rotor, but also the required small parts and installation instructions.

6.4.2 Ad usting the brake air gap

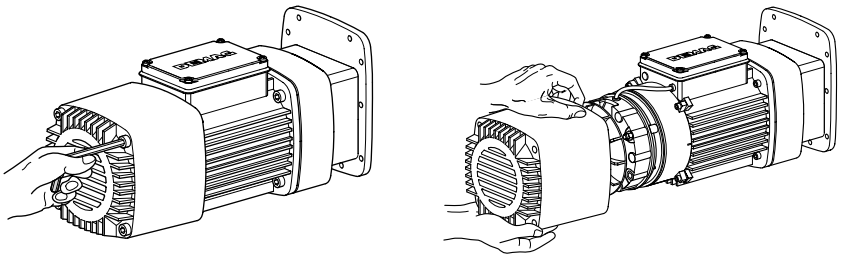
The air gap must be adjusted when the max. permissible value given in the “Brake settings” tables in section 6.5 has been reached, (however, immediately if the brake no longer releases). The time to adjust the brake can be determined using the “Adjustment monitoring” option, estimated from the work done by the brake according to the “Brake settings” tables in section 6.5, or established by regular inspections.

If the brake is not ad usted, it will no longer release after further wear. If the motor then operates against the applied brake, the brake and motor may be damaged and fail.

Condition: Brake and fan cover fully fitted

Tools required:
- Open wrench, feeler gauges, pliers for retaining rings to DIN 5254
- Long hexagon socket key

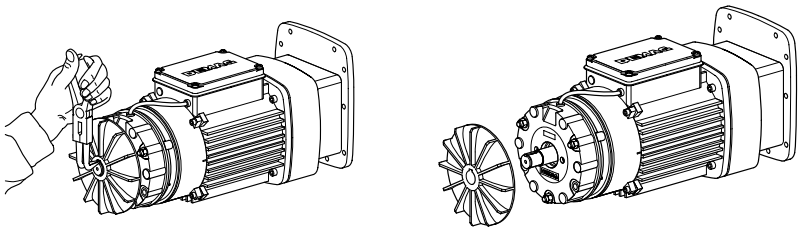
214206k3.p65/0999



Undo the four screws and remove the fan cover.

41431944.eps

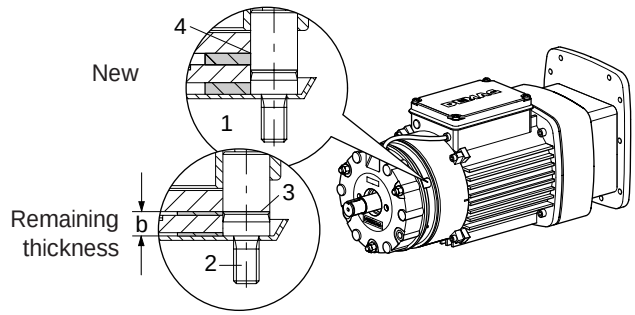
41432044.eps



If the adjusting nuts are not accessible, remove the fan.
[For **Sealing arrangement** option remove the fan.]
Remove or suck the loose brake abrasion from the inside of the brake enclosure.
Beware of the dust if the abrasion is blown out of the enclosure.

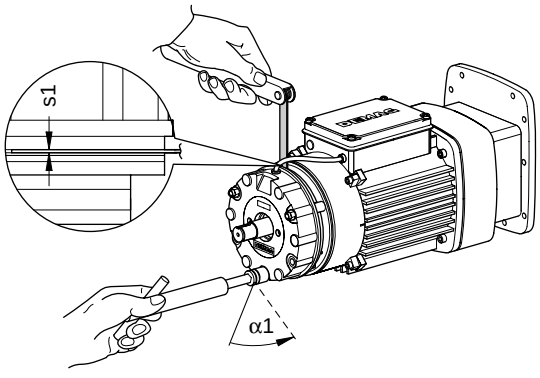
41432144.eps

41432244.eps



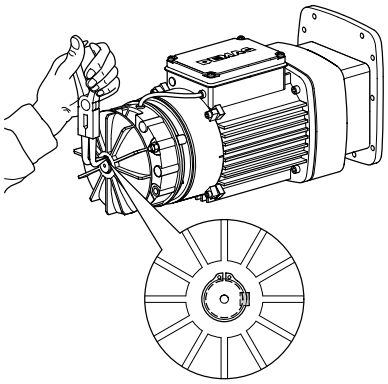
Check the remaining thickness of the brake disk with friction linings (1). The guide pins (2) feature a mark (3) which the armature disk edge (4) must not cover. If the armature disk edge (4) has reached the mark (3), the brake disk (1) must be replaced.
(For instructions refer to section 6.4.3 **Replacing the brake disk** .)

41437955.eps



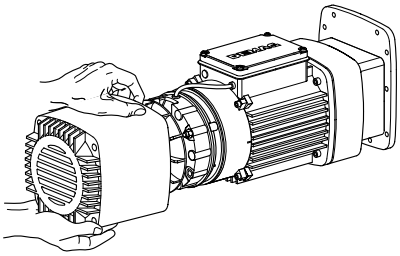
41444245.eps

If the remaining thickness of the brake disk (1) is sufficient, adjust the brake as follows:
Tighten the three self-locking nuts uniformly until the air gap is zero. Loosen the nuts by angle α_1 given in the **Brake settings** table in section 6.5 to set the air gap to s_{1min}.
Check air gap s_1 using a feeler gauge at three points around the circumference (adjust again if necessary).
Note The rotor shaft must be able to turn freely when the brake is released.
Check the brake for correct functioning.



[For **Sealing arrangement** option, replace the covering tape.]
If the fan has been removed: fit the fan and, if applicable, the key.
Secure the fan with the retaining ring. Ensure the retaining ring clicks correctly into place (see diagram).

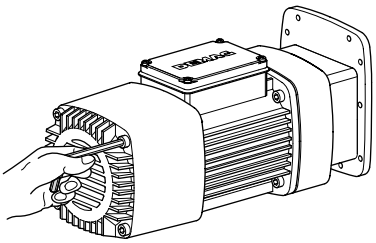
41433244.eps



Align the fan cover as appropriate for the model.

Secure the fan cover with the four screws.

41432044.eps



41431944.eps

6.4.3 Replacing the brake disk

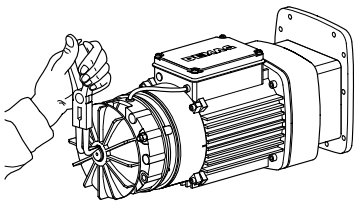
Note: **Damaged brakes may only be repaired by a Mannesmann Dematic authorised workshop.**

To ensure reliable functioning of the brake, the lining must be of a thickness defined as the minimum remaining thickness in the **Brake settings** tables in section 6.5.

The brake disk is a wearing part and **must** therefore **be replaced** on reaching its minimum thickness. The friction plate and armature disk must be checked and replaced, if necessary.

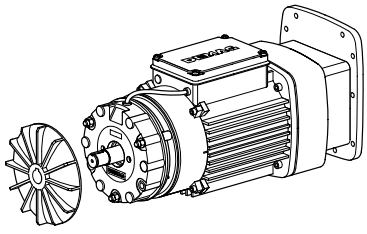
Condition: Fan cover and covering tape removed
(see section 6.4.2 **Ad usting the brake air gap**).

Tools required:
- Open wrench, wearing part kit, feeler gauges, pliers for retaining rings to DIN 5254
- Long hexagon socket key

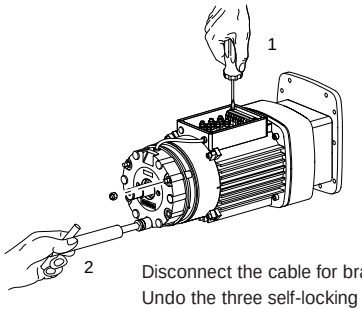


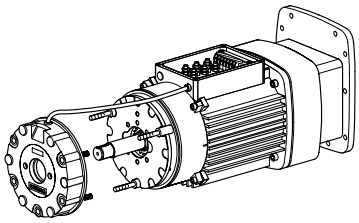
Remove the retaining ring and fan.

41432144.eps



41432244.eps





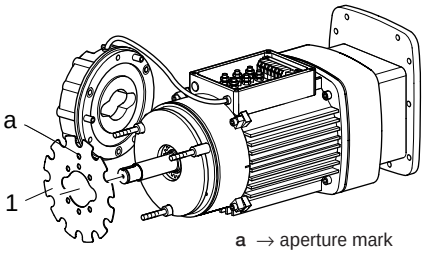
Disconnect the cable for brake coil and microswitch (1), if applicable. Pull the cable out of the terminal box far enough to do the following.

Undo the three self-locking nuts (2) used for adjustment (pay attention to tension of brake and distance springs). The collared pins must not be unscrewed, tighten them to the tightening torque specified in section 6.5 if necessary.

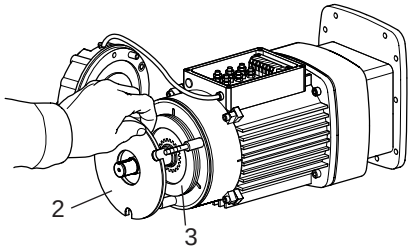
Carefully pull the magnet assembly off the three collared pins and the motor shaft.

For vertical mounting arrangement (brake at the top): fix the brake springs and, if applicable, the plunger (microswitch option) in place with strips of adhesive tape or a rubber band.

41432344.eps 41432444.eps



a → aperture mark



Remove stop plate (1). Pay attention to the distance springs, these can remain on collared pins. (Replace the brake springs when changing the brake disk.)

Remove armature disk (2) (both disks for the **Reduced noise level** and **Manual brake release** options) and brake disk (3).

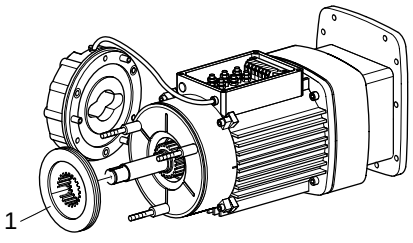
Remove or suck the loose brake abrasion from the inside of the brake enclosure. **Beware of the dust if the abrasion is blown out of the enclosure.**

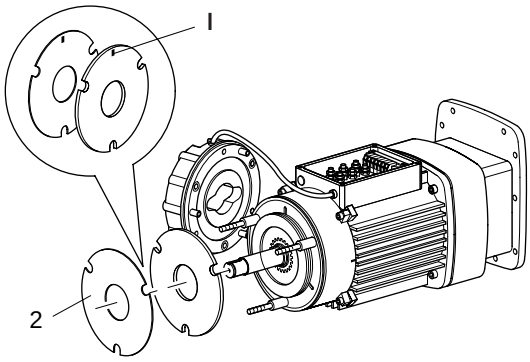
Check the armature disk and, up to size B050, the friction plate for damage, excessive scoring or similar, also check the friction plate (fitted up to size B050) for deformation and the collared pins for extreme differences in diameter.

Replace worn or damaged parts.

Ensure that the outside circumference is not damaged when fitting a new collared pin (use a counter-nut).
Attention must also be paid to the tightening torques as specified in the tables in section 6.5.

41432544.eps 41432844.eps



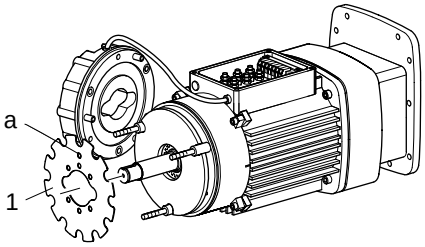


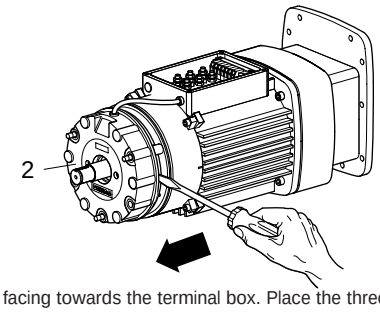
Place brake disk (1) centrally on the carrier. **Pay attention to correct alignment and do not use force. Keep the friction surfaces clean (no grease on the friction surfaces) as the initial friction coefficient will otherwise be changed.**

Align armature disk (2) (the thicker disk first for the **Reduced noise level** and **Manual brake release** options) with marker **I** facing the terminal box and then fit the armature disk on the collared pins.

(The end shield must have been fitted correctly with the mark in the right position.)

41432744.eps 41432644.eps

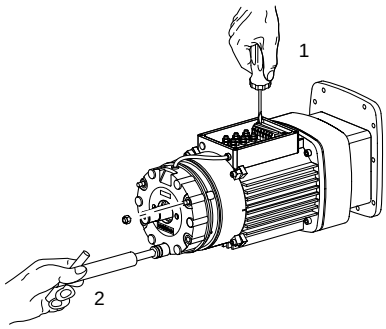




Align stop plate (1) and place it on the collared pins in such a way that aperture mark **a** is facing towards the terminal box. Place the three distance springs on the threaded ends of the collared pins. Fit brake springs symmetrically into the magnet as before or as specified in the **Brake settings** table in section 6.5. For the vertical mounting arrangement with the brake at the top, prevent the springs from falling out using rubber bands or similar (rubber band grips the outside of the brake springs). Align magnet (2) (with the opening for the operating lever facing towards the terminal box for the **Manual brake release** option) and push it into place. Fit the self-locking nuts on the collared pins. Ensure the stop plate is guided by the three collared pins and does not get caught in the distance springs before the collared pins engage the magnet.

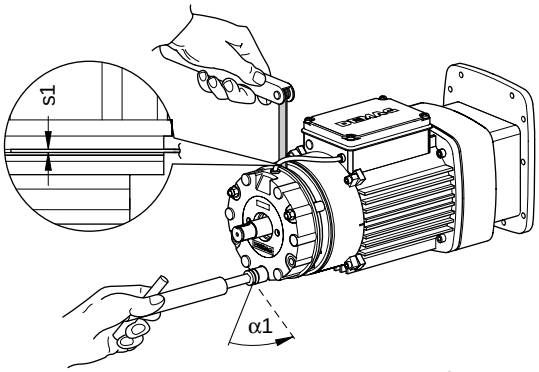
41432544.eps

41433144.eps



Pull the cable back into the terminal box. Connect the cable for the brake coil and, if applicable, microswitch (1).

41432344.eps



41444245.eps

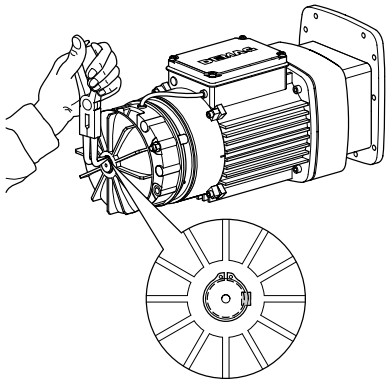
Adjust the brake as follows:

Tighten the three self-locking nuts uniformly until the air gap is zero. Loosen the nuts by angle α_1 given in the **Brake settings** tables in section 6.5 to set the air gap to s_{1min}.

Check air gap s_1 using a feeler gauge at three points around the circumference (adjust again if necessary).

Note The rotor shaft must be able to turn freely when the brake is released.

Check the brake for correct functioning after reconnecting the brake coil.

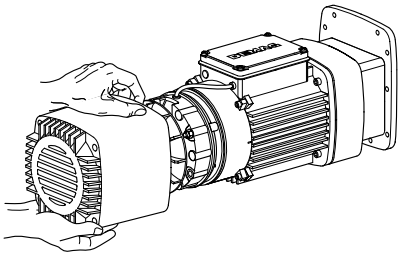


41433244.eps

For **Sealing arrangement** option, replace the covering tape.

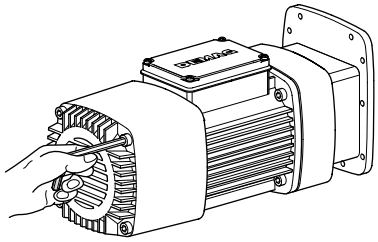
Fit the fan and, if applicable, the key.

Secure the fan with the retaining ring. Ensure the retaining ring clicks correctly into place (see diagram).



41432044.eps

Align the fan cover as appropriate for the model.



41431944.eps

Secure the fan cover with the four screws.

6.5 Brake settings tables

Tightening torque for cast aluminium	9 Nm	18 Nm	45 Nm	75 Nm	–	–

7 Motor brake connection diagrams

7.1 Brake control

Various control modules are available which are fitted in the brake motor terminal box as standard for controlling Demag B004 to B680 disk brakes with DC magnets. Brakes up to size

- B050 for ZBA motors
- B140 for ZBF motors

featuring **24 V DC coil voltage** must be supplied and controlled by the installation control system.

All rectifiers feature varistor protection against overvoltage at the AC input and on the switching contact terminal as standard. GE, GS and GP brake rectifiers can be used for voltages from 42 V AC to 500 V AC.

GE, GS and GP brake rectifiers can be fed separately with alternating current or connected parallel to the motor winding. AC or DC brake control is possible with all brake rectifiers depending on the connection.

The control system is of modular design. SE or VE modules for fast DC interruption of the brake current can be added to brake motors fitted with GE, GS or GP brake rectifiers, also at a later date, without the need for additional cables and switching devices.

Operation with frequency inverters

If B cylindrical rotor brake motors are operated together with inverters, the brake must be provided with a separate power supply and control.
Brake application times are highly dependent on the way in which the brake is connected.

Supply and brake voltage:

U_{line} **[AC]**	U_{brake} **[DC]**
230 V	104 V
400 V	180 V

Brake control modules

GE brake rectifiers (normal excitation)

GE half-wave brake rectifiers are used for single-speed motors as standard, and for pole-changing motors featuring separate power supply up to brake size

– B050 for ZBA motors
– B140 for ZBF motors.

They mainly consist of a half-wave rectifier with integrated free-wheeling circuit.

Important **When used with a pole-changing motor, GE modules must be provided with a separate power supply or according to diagram 037 860 84 (see section 7.5).**

Note When SE or VE units are used, no additional cables are necessary.

214206k4.p65/0999

GS brake rectifiers (high-speed excitation)

GS brake rectifiers are used for ZBA motors with brakes as of size B140 as standard. They can be used for single-speed motors as well as for pole-changing motors with a separate power supply

GS brake rectifiers can be used as an option for brake sizes B004 to B050. This makes it possible to achieve shorter brake release times and higher motor starting frequencies.

Up to brake size B050, two leads are sufficient for control (over-excitation factor of 2), from brake size B140 on, three leads are required (over-excitation factor of 2,5).

GS modules include a reversible rectifier which overexcites the brake for approx. 0,3 seconds to release it and then supplies it with the appropriate holding voltage from a half-wave rectifier.

Important **When used with a pole-changing motor, GS modules must be provided with a separate power supply or according to diagrams 037 886 84, 038 001 84 and 038 017 84 (see section 7.5).**

Note When SE or VE units are used, no additional cables are necessary.

GP brake rectifiers (normal excitation for pole-changing motors)

GP brake rectifiers can be used parallel to the motor winding for pole-changing motors with separate windings. For this, it is necessary for both windings to be connected to one phase on the terminal board (e.g. 1U & 2U). The advantage of using a GP brake rectifier compared to a GE module is that no additional cables are required for the power supply. GP rectifiers mainly consist of two half-wave rectifiers which are connected depending on the winding being used.

Note When SE or VE units are used, no additional cables are necessary.

SE current relays (motor current-dependent high-speed trip relay)

SE current relays can be combined with GE, GS and GP brake rectifiers. They are used for rapid demagnetization of the brake to achieve fast brake application times without the need for additional wiring for brake switch-off in the DC circuit. SE current relays are connected to one motor current phase. When the motor is switched off, the relay demagnetizes the brake by opening the contact in the DC circuit.

When SE units are used, no additional cables are necessary to interrupt the power supply for the brake.

Important **SE modules must not be used together with inverters. We recommend the use of VE voltage relays for these applications.**

SE current relays can be used for rated motor currents up to 50 A.

VE voltage relays (voltage-dependent high-speed trip relay)

VE voltage relays can be combined with GE, GS and GP brake rectifiers. In contrast to SE current relays, **VE voltage relays must only be used for brakes with a separate power supply**.
These modules may preferably be used for inverter-fed motors. They are used for high-speed demagnetization of the brake to achieve fast brake application times without the need for additional wiring for brake switch-off in the DC circuit. VE voltage relays are connected to the brake power supply. The contact in the DC circuit is opened when the brake is switched off.

Brake control module technical data

Module	Ident. no.	Voltage range in V [1]	Max. continuous brake direct current A	Remarks	
GE	260 892 84	110 ... 500	1,5		
	260 890 84	42 ... 500	3

[1] The SE modules are allocated as follows depending on the rated motor current:

Rated motor current	Module	Part no.
≤ **4 A**	SE	260 864 84
≤ **16 A**		260 870 84
≤ **50 A**		260 896 84

7.2 Brake operating times

Brake application times are highly dependent on the way in which the brake is connected.

- **Direct current connection**

  The coil circuit is interrupted when the brake module contact opens at the relevant terminal. The magnetic field rapidly decreases and the brake torque rapidly rises. Mannesmann Dematic rectifiers are protected against overvoltage at the switching contact by varistors.

  Interruption of the DC circuit between the module and the coil connections is not permitted.

- **Connection in the AC circuit**

  When the brake voltage is switched off, i.e. on the supply side before the rectifier, an inductive coil current continues to flow through the rectifier diodes for a short time. The magnet field decreases more slowly. The braking operation begins more smoothly.

  This connection type is not suitable for hoist drives.

- **Connection in the motor circuit**

  The rectifier is connected directly to the motor terminals. When the motor is switched off, the residual motor voltage results in significantly longer switch-off times compared to switch-off in the AC circuit.

  Unless provided with switch-off in the DC circuit using a contact or the SE current relay, this type of connection is not suitable for drives with overhauling loads, e.g. hoists, and may not be used in these applications.

Depending on the type of connection, the release and braking operation of B004 to B680 DC brakes can generally be characterized by the following values:

- t_{11} Brake release time with normal excitation (GE, GP) [1)]
- t_{12} Brake release time with high-speed excitation (GS) [1)]
- t_{21} Brake application time for switch-off in the AC circuit
- t_{22} Brake application time for switch-off in the DC circuit (contact)
- t_{23} Brake application time for switch-off in the DC circuit (SE, VE)

[1)] Definition: **The brake release time is the period of time which elapses until the full accelerating torque of the motor is available.**

Brake release times may be reduced using high-speed excitation modules with which a higher voltage is temporarily applied to the brake coil when the brake is turned on and the magnetic field is built up more quickly.

7.2.1 BA range brake operating times

Size	Release times in ms		Application times in ms		
	t_{11}	t_{12}	t_{21}	t_{22}	t_{23}
B004	60	35	250	55	85
B007	120	60	90	30	60
B020	130	90	40	20	30
B050	120	100	90	30	80
B140	–	110	60	30	60
B280	–	140	300	90	160
B680	–	140	300	150	225

The brake release and application times given are guide values for the maximum brake torque. In the case of lower brake torques, these values may change, particularly t_{21} for switch-off in the AC circuit.

7.2.2 BF range brake operating times

Table 10

Si e	Release times in ms		Application times in ms		
	t_{11}	t_{12}	t_{21}	t_{22}	t_{23}
B004	30	25	200	30	40
B020	60	40	300	50	60
B050	80	65	300	60	70
B140	110	90	350	100	100

The brake release and application times given are guide values for the maximum brake torque (see table 9). In the case of lower brake torques, these values may change, particularly t_{21} for switch-off in the AC circuit.

7.3 Selection criteria

The following criteria must be considered when selecting the connection diagram:

- **Brake motor or motor without brake**
- **Motor to be operated with**
  - one line voltage (e.g. 400 V, 50 Hz) or
  - two line voltages (e.g. Δ/Y 230/400 V 50 Hz or YY/Y 240/480 V 60 Hz)
- **Brake type**
  - B007 to B140 DC brake
  - B002 AC brake
- **Motor designed for one or two speeds**
- **Common or separate power supply to motor and brake**
- **Control module selected**
  - GE for normal excitation
  - GS for high-speed excitation
  - GP for normal excitation for pole-changing motors
- **Switch-off**
  - in the DC circuit for short operating times (e.g. hoist drives, positioning drives)
  - in the AC circuit for medium operating times (e.g. travel drives, conveyor belts)
  - in the motor circuit for stopping the motor in an uncritical time.

Refer to the following flow chart.

Notes

- The motor and brake of inverter-fed drives must have **separate** power supplies
- **SE modules** must **not** be used with inverter-fed drives.
- **Connection diagrams**
  - Connection diagram selection (flow chart) for line and inverter-fed drives and related tables → section 7.4.
  - Connection diagrams → section 7.5.
    Diagrams shown in numerical order according to ident. no.
  - Connection diagrams arranged in the motor terminal box.
- **Condition when supplied for inverter operation**
  When motors are supplied for **inverter operation**, **GE**, **GS** or **GP** Brake control modules are **not** connected with the motor winding as shown in the individual connection diagrams which document the motor connection on delivery.
  The brake control module must be provided with a **separate AC power supply**.

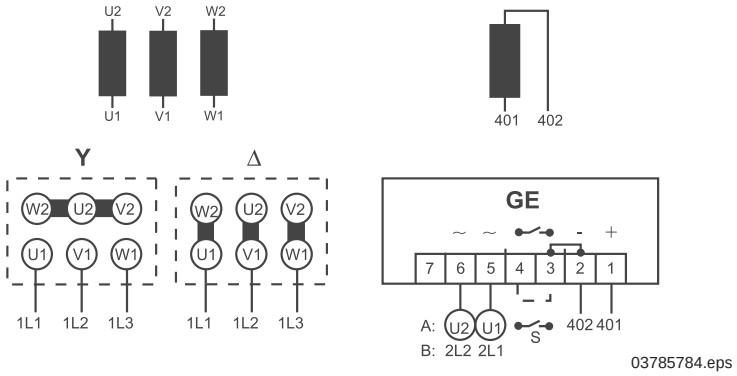
Brake coil rated for the low voltage.



03785784.eps

Motor supplied with

- Jumper parts to connect the motor winding with Y or Δ connection enclosed.
- Brake connected to terminals 1 and 2 of the GE module.
- Jumper between terminals 3 and 4 of the GE module.
- **Mains operation** GE module connected with the motor winding according to variant A.
- **Inverter operation** – GE module **not** connected to the motor winding.
  – Power supply by the customer according to variant B.

037 857 84

A Common power supply to motor and brake

Not suitable for inverter operation.

B Separate power supply to brake

For inverter operation, connect the motor with Y or Δ connection according to inverter settings.

Switch-off in the DC circuit

- Remove jumper between terminals 3 and 4.
- Connect a contactor between terminals 3 and 4.

Switch-off in the AC circuit

- Jumper between terminals 3 and 4.
- Contactor in the power line behind terminal 5.

Motor current switch-off

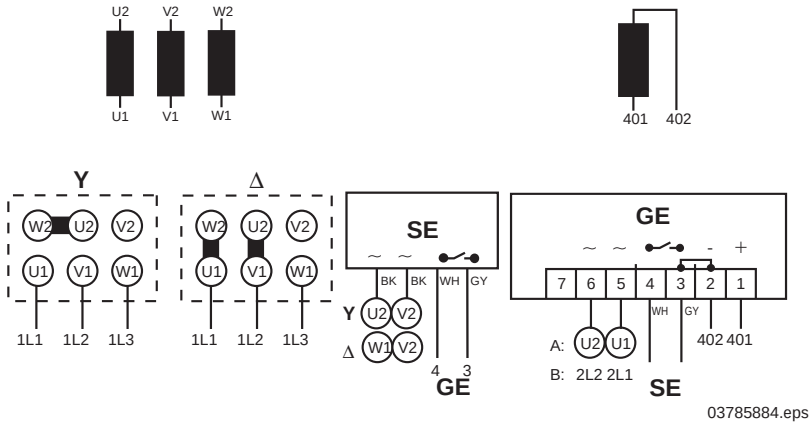
Jumper between terminals 3 and 4
→ **not possible for separate power supply to the brake**

Dual voltage motor (1 $\sqrt{3}$)

A Common power supply to motor and brake
B Separate power supply to brake

Y high voltage
Δ low voltage

Brake coil rated for the low voltage.



03785884.eps

Switch-off in the DC circuit dependent on motor current

Not suitable for inverter operation.

Motor supplied with

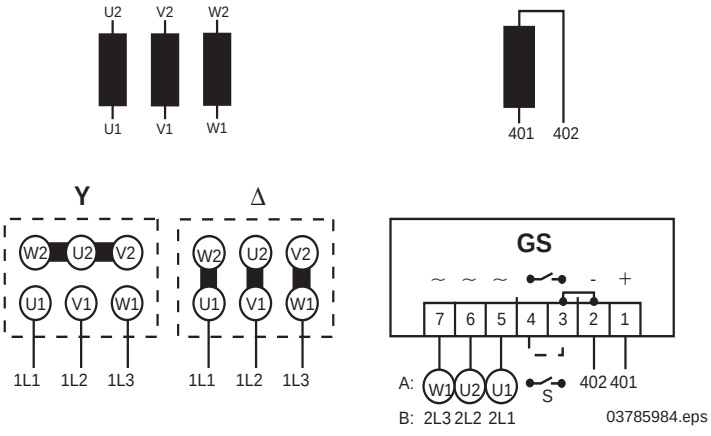
- Jumper parts to connect the motor winding with Y or Δ connection enclosed.
- Brake connected to terminals 1 and 2 of the GE module.
- SE module connected to terminals 3 and 4 of the GE module.
- SE module connected with the motor winding according to variant Y.
- GE module connected with the motor winding according to variant A.

037 858 84

Dual voltage motor (1 $\sqrt{3}$)

Y high voltage Δ low voltage

Brake coil rated for the low voltage.



03785984.eps

A Common power supply to motor and brake

Not suitable for inverter operation.

B Separate power supply to brake

For inverter operation, connect the motor with Y or Δ connection according to inverter settings.

Switch-off in the DC circuit

- Remove jumper between terminals 3 and 4.
- Connect a contactor between terminals 3 and 4.

Switch-off in the AC circuit

- Jumper between terminals 3 and 4.
- Contactors in the power lines behind terminals 5 and 6.

Motor current switch-off

Jumper between terminals 3 and 4
→ **not possible for separate power supply to the brake**

Motor supplied with

- Jumper parts to connect the motor winding with Y or Δ connection enclosed.
- Brake connected to terminals 1 and 2 of the GS module.
- Jumper between terminals 3 and 4 of the GS module.
- **Mains operation** GE module connected with the motor winding according to variant A.
- **Inverter operation** – GE module **not** connected to the motor winding.
  – Power supply by the customer according to variant B.

037 859 84

Δ for low speed
YY for high speed

Switch-over to high speed winding via external supply switch-over and jumper.

Separate DC supply to brake

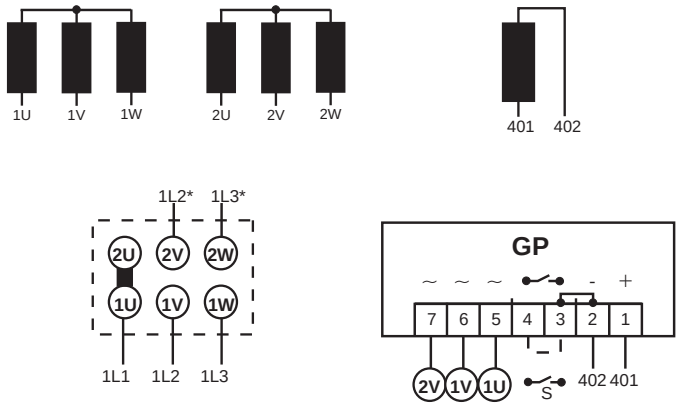
Motor supplied with

Brake connected to Euro terminals.

Important **The brake will not function without a separate DC supply to the brake.**

037 871 84

Motor for one line voltage, pole-changing, separate windings Common power supply to motor and brake



03787284.eps

* = Supply to high speed winding via external switch-over.

1U, 1V, 1W for low speed
2U, 2V, 2W for high speed

Not suitable for inverter operation.

Switch-off in the DC circuit

- Remove jumper between terminals 3 and 4
- Connect contactor between terminals 3 and 4

Switch-off in the AC circuit

- Jumper between terminals 3 and 4
- Contactor in the power line behind terminal 5

Motor current switch-off

Jumper between terminals 3 and 4

Motor supplied with

- Jumper parts to connect the motor winding enclosed.
- Brake connected to terminals 1 and 2 of the GP module.
- Jumper between terminals 3 and 4 of the GP module.
- GP module connected with the motor winding as in the connection diagram.

037 872 84

1U, 1V, 1W for low speed
2U, 2V, 2W for high speed

Voltage-dependent switch-off in the DC circuit

Motor supplied with

- Jumper parts to connect the motor winding enclosed.
- Brake connected to terminals 1 and 2 of the GS module.
- VE module connected to terminals 1, 3 and 4 of the GS module.

Important **The brake will not function without a separate power supply to terminals 5, 6 and 7 of the GS module.**

038 020 84

7.6 Connecting temperature and brake monitoring devices

Depending on the motor features, the connections for temperature monitoring and/or brake monitoring are brought out on Euro terminals in the terminal box.

The following connection designations are used:

PTC thermistor

– Switch-off: **101 - 102** and **201 - 202**
– Warning: **111 - 112**

Important PTC thermistors to DIN 44081 are suitable for tripping devices with 2,5 V DC output voltage and 4 kΩ tripping resistance.
PTC thermistors may only be continuity tested with max. 2,5 V DC. Do not use a buzzer (voltage peaks) or similar devices. The resistance of **one** PTC thermistor is 20 ... 250 Ω at temperatures of –20 °C to ϑ_{TNF} – 20K. (TNF = rated operating temperature).

Temperature detector (bimetallic switch) **601 – 602**

Brake monitoring

– Release monitoring: **801 – 802 – 803**
Contact 2 (802 – 803) closed:
Brake not released, brake in applied position
Contact 4 (801 – 803) closed:
Brake released

– Adjustment monitoring: **804 – 805 – 806**
Contact 2 (805 – 806) closed:
Brake must be adjusted
Contact 4 (804 – 806) closed:
Normal operating condition

The diagrams below show the most important single connections.
When several monitoring devices are used (such as PTC thermistors for the motor and release monitoring for the brake), the individual circuits are combined in one connection diagram which can be found inside the motor terminal box.

8 Technical data

Motor

Function conditions for standard design

Conditions			
Transport temperature	-20 ... +40°C		
Storage temperature	0 ... +40°C		
Storage conditions	Dry, indoors		
Ambient operating temperature	-20 ... +40°C		
Environment	Acid-free		
Coolant	Air		
Coolant temperature	max. +40°C		
Temperature rise limit of winding	105K		
Installation site height	max. 1000 m above sea level		
Air circuit	Ensure by w orking clearance, unrestricted air intake		
Enclosure	IP54		
Mounting arrangement	Low vibration		
Working clearance at fan end	150 mm at rear		
Line voltage	400V/50Hz	480V/60Hz	500V/50Hz
Voltage tolerance	±10% of the line voltage		
Max. speed	3600 rpm		

Gearbox

Function conditions for standard design

Conditions	
Transport temperature	-20 ... +40°C
Storage temperature	0 ... +40°C
Storage conditions	Dry, indoors
Ambient operating temperature	-10 ... +50°C
Environment	Low dust level, acid free
Coolant	Air
Coolant temperature	max. +40°C
Installation site height	max. 1000 m above sea level
Air circuit	Free circulation
Enclosure	IP 55
Mounting arrangement	Low vibration
Working clearance	Ensure free air circulation
Max. input speed	3600 rpm
Lubrication	see rating plate

9 Troubleshooting

Item	Problem	Possible cause	Solution
1	Motor does not start.	Fuse has tripped.	Replace fuse.
		Power supply line interrupted	Check connections.
		Motor protection has tripped.	Check motor protection for correct setting.
		Control defective.	Check motor connection.
		Brake does not release.	See section 10 **Brake does not release**
2	Motor does not start or or starts slowly.	Motor for delta connection connected in star	Correct motor connection.
		Extreme voltage or frequency deviation from setpoint value.	Improve quality of power supply; check power supply line cross-section.
3	Motor will not start in star connection, only starts in delta connection.	Insufficient torque in star connection.	If the delta starting current is too high, start up direct in star connection, otherwise use larger motor or special design (contact manufacturer).
		Contact fault in star-delta starter.	Eliminate fault.
4	Motor runs in wrong direction.	Motor incorrectly connected.	Interchange two supply leads.
5	Motor hums and has high power consumption.	Winding defective.	Motor must be sent to specialist workshop for repair.
6	Fuses trip or motor protection trips immediately.	Short-circuit in the supply line.	Eliminate short-circuit.
		Short-circuit in the motor.	Motor must be sent to specialist workshop for repair.
		Power supply cable incorrectly connected.	Correct connection.
		Short-circuit to earth in the motor.	Motor must be sent to specialist workshop for repair.
7	Extreme loss of speed under load.	Overload.	Measure power, use larger motor or reduce load, if necessary.
		Voltage drop.	Increase power supply line cross section.
8	Excessive motor temperature rise (measure temperature).	Overload.	Measure power, use larger motor or reduce load, if necessary.
		Insufficient cooling.	Correct cooling air circulation or clear air circulation channels, fit separate fan, if necessary.
		Separate fan not running.	Check connection, correct if necessary.
		Ambient temperature too high.	Reduce power, use larger motor, if necessary
		Delta connection instead of star connection as specified.	Correct connection.
		Temporary two-phase operation.	Intermittent electrical contact in the power supply line.
		Fuse has tripped.	Replace fuse.
		Mains voltage differs from the rated motor voltage by more than 10%. Higher voltages are particularly unfavourable for low-speed motors as their no-load current is close to the rated current even at normal voltage.	Match motor to power supply voltage.
		Duty type (S1 - S10, EN 60034-1) exceeded, e.g. starting frequency too high.	Adapt operating conditions to corresponding motor duty type.
9	Excessive noise.	Friction bearing distorted, dirty or damaged.	Realign motor, inspect friction bearings, replace if necessary.
		Rotating parts vibrating.	Correct any imbalance.
		Foreign bodies in cooling air circuit.	Clean cooling air circuit.
10	Brake does not release.	Incorrect voltage applied to brake control unit.	Apply correct voltage (see rating plate).
		Brake control unit failure.	Change brake control unit, check brake coil (resistance), check switchgear.
		Max. permissible air gap exceeded because the brake lining is worn out.	Adjust the brake (replace the complete brake lining carrier if the lining is worn out).
		Voltage drop in the power supply line > 10 %.	Ensure correct supply voltage is applied.
		Brake coil short-circuit with the winding or housing.	Change complete brake with control unit (specialist workshop), check switchgear.
11	Motor does not brake.	Brake lining worn out.	Replace the complete brake lining carrier.
		Manual brake release device incorrectly adjusted.	Set adjusting nuts to correct setting.
		Manual brake release device locked.	Release lock, remove lever.
		Incorrect brake torque.	Change brake torque.

0 Foreword

You have purchased a Mannesmann Dematic product. This equipment was manufactured in accordance with state-of-the-art engineering principles.

These operating instructions are designed to provide the operator with appropriate instructions for safe and correct operation and to facilitate maintenance.

Every individual given the task of transporting, installing, commissioning, operating, maintaining and repairing our motors and additional equipment must have read and understood

- the operating instructions
- the safety regulations and
- safety instructions in the individual chapters and sections.

The operating instructions must be available to the operating personnel at all times in order to prevent operating errors and to ensure smooth and trouble-free operation of our products.

0.1 Copyright

These operating instructions must be treated confidentially. They should only be used by authorized personnel. They may only be entrusted or made available to third parties with the prior written consent of Mannesmann Dematic. All documents are protected within the sense of copyright law.

No part of this documentation may be reproduced, utilized or transmitted without specific prior consent. Infringements are an offence resulting in obligatory compensatory damages. All industrial rights reserved.

0.2 After-sales service

For technical information on Mannesmann Dematic products and their systematic application, please refer to one of our after-sales service stations, the relevant representative or to our main office in Cleveland, Ohio.

0.3 Guarantee

These operating instructions must be read carefully before installing and putting the product into operation.

We assume no liability for damage and malfunctions resulting from failure to comply with the operating instructions.

Wearing parts are not subject to the guarantee, guarantee claims must be made by quoting the order number to Mannesmann Dematic immediately on detecting the defect.

The guarantee is cancelled, for example, in the event of:

- inappropriate use,
- faulty devices or equipment connected or attached to the product which are not part of our scope of supplies and services,
- use of non-genuine spare parts and accessories,
- refurbishment or modification of the product unless approved in writing by Mannesmann Dematic.

0.4 Liability

All technical information, data and instructions for operation contained in these operating instructions were up-to-date on going to print and are compiled on the basis of our experience and to the best of our knowledge.

We reserve the right to incorporate technical modifications within the scope of further development of the geared motors which are the subject of these operating instructions. Therefore, no claims can be derived from the information, illustrations and descriptions contained in these operating instructions.

The descriptions and illustrations contained in this documentation do not necessarily correspond to the scope of delivery or any subsequent spare part delivery, either; the drawings and illustrations are not to scale. Only documentation belonging to the actual order is valid.

We assume no liability for damage and malfunctions caused as a result of operating errors, noncompliance with these operating instructions or inappropriate repairs and maintenance. We expressly point out that only Mannesmann Dematic spare parts and accessories approved by us may be used. Accordingly, this also applies to other manufacturers' parts used. For safety reasons, the fitting and use of spare parts or accessories which have not been approved and unauthorized modification and conversion of the product are not permitted and exempt Mannesmann Dematic from any liability for damages resulting therefrom.

With the exclusion of any further claims, Mannesmann Dematic is liable for any faults or omissions on our part within the scope of the warranty obligations entered into in the original contract. Claims for damages – except for legal claims resulting from product liability legislation – are excluded, irrespective of the legal reason from which such claims are derived.

0.5 Definitions

Owner

Owners (employer, company) are defined as persons who own the product and who use it appropriately or allow it to be operated by suitable persons.

Operating personnel

Operating personnel are defined as persons assigned by the owner of the product to carry out special tasks such as installation, operation, setting-up, maintenance including cleaning, fault elimination and transportation of the product.

Specialist personnel

Specialist personnel are defined as persons assigned by the owner to carry out specific tasks.

- **ualified personnel**

  Qualified personnel are defined as persons, who, owing to their technical training, knowledge and experience as well as knowledge of the relevant standards, are able to assess the tasks given to them and identify potential hazards.
- **Trained person**

  Trained persons are defined as persons who have been instructed and trained for the tasks assigned to them and on the possible hazards resulting from incorrect handling and who have been informed about the required protective devices, protective measures, relevant regulations, codes of practice, accident prevention regulations and operating conditions and who have proven their qualifications.
- **Experienced technician**

  Experienced technicians are defined as persons, who, owing to their technical training and experience, have sufficient knowledge of the product and are familiar with the relevant national industrial safety regulations, codes of practice, accident prevention regulations, directives and generally accepted engineering standards enabling them to judge the safe operating condition of the motors.

229203k1.p65/1099

1 Safety

1.1 Symbols

The following symbols and recommendations indicate potential safety hazards or causes of damage or provide useful information.

a ard warning

This symbol appears in the operating instructions next to all instructions relating to safety at work wherever a potential hazard to life and limb exists if the instructions are not complied with.

Follow these instructions at all times and be particularly careful and cautious.

Pass on safety instructions to all persons entrusted with working on motors including the power supply.

In addition to the safety instructions, observe all general safety regulations and codes of practise at all times.

Warning against electrical ha ards

Contact with live parts can result in immediate death. Protective covers (e.g. covers and enclosures) may only be opened by qualified electricians. Before opening, all relevant operating, control, feed or other voltages must be disconnected.

Operating ha ard for the installation

This symbol in the operating instructions indicates all warnings which, if not complied with, may result in damage to motors.

1.2 Intended use

These motors may be used for all travel, lifting and turning motions in industrial applications. Compliance with the permitted operating conditions must be ensured for operation of these drives (e.g. enclosure type, ambient temperature, installation height).

1.3 Prohibited practises, improper use

Under certain conditions, operation of standard motors is prohibited as this could result in malfunctions, faults in the equipment or hazard to life and limb, e.g.:

- Acidic, corrosive air as coolant
- Operation outside the permitted temperature range
- Operation beyond the normal air pressure. Otherwise, power adjustments are necessary
- Operation under conditions of high humidity or splashwater
- Manipulation of electrical modules

Safety devices must not be rendered inoperable or modified or used in any way other than that for which they have been designed.

1.4 Safety instructions

The relevant national accident prevention regulations and the general safety conditions must always be observed when our products are operated in order to avoid accidents and damage to machinery. If the safety instructions given in these operating instructions are not observed in any way, personal injury or even death can result.

Dangerous voltage

Motors are connected to a mains power supply. Any contact with live parts can lead to very serious injury or even death.

Putting motors into operation

Do this only

- if you have read the operating instructions and the owner has instructed you in all details,
- if the operating instructions are available for reference at the place of operation,
- if you are qualified personnel (electrician),
- if you are **not** under the influence of drugs, alcohol or medication that can adversely affect your ability to react,
- if the general accident prevention, operating and installation regulations have been observed.

Additional safety instructions

Only carry out maintenance and installation work

- if you are qualified personnel (electrician),
- if the motors are at zero voltage,

- if no hazard exists (e.g. crushing hazard, slipping hazard, etc.),
- if the motors are secured against restoration of the power supply,
- if all cables and motor terminals are at zero potential (establish with a voltmeter),
- with insulated tools,
- using genuine spare parts.

2292203k1.p65/1099

2 Receiving, transport and storage

2.1 Receiving

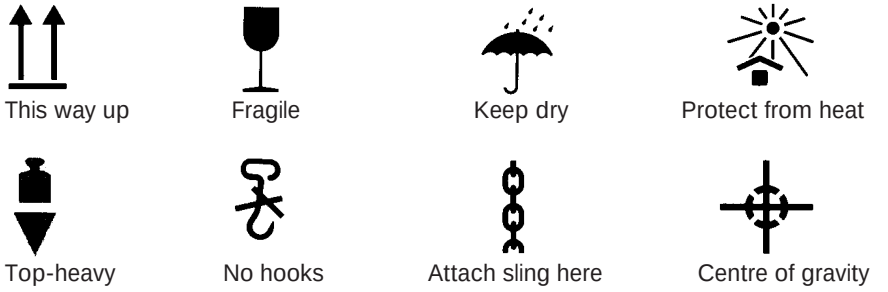
The scope of delivery is specified in the shipping papers. Check the delivery immediately on receipt to ensure that it is complete and examine it for damage caused in transit. If necessary, a damage report must be made out in the presence of the transport contractor's representative as otherwise it will not be possible to rectify the damage at no cost to you.

2.2 Transport

The drive is supplied made up into one unit. Additional equipment may be supplied in separate packaging.

The drive is packed depending on the transport method and its weight. Unless otherwise agreed in the purchase contract, the packaging corresponds to the packaging guidelines of Mannesmann Dematic.

Symbols used on the packing



41283944 - 41284644.eps

Handle motors with utmost care to avoid damage caused by careless loading and unloading, for example.

2.3 Storage

Motors must be stored as follows:

- in dry places with low temperature fluctuations
- in the same position as for operation
- protected against dust and moisture
- on a wooden support
- free from vibration (no impacts)

Drives must not be stacked on top of each other.

Unless otherwise agreed in the purchase contract, standard conservation is guaranteed for a period of 6 months. The guarantee period begins on the day the unit is delivered.

Contact Mannesmann Dematic in Cleveland, Ohio, if the motors are to be stored for periods of longer than 6 months.

Important **Motors may otherwise be damaged.**

3 Product description

3.1 Motor

Demag type Z cylindrical rotor motors can be supplied with or without brake (ZB and ZN motors). The ZBA and ZNA motor range includes frame sizes Z..63 to Z..225. The motor range includes pole-changing designs and motors with integrated fly wheels for particularly smooth load movement.

- The housings of motor frame sizes Z..63 to Z..132 are of a high quality aluminium alloy with an integrated terminal box base. The terminal box cover and fan cover are made of plastic.
- Motor frame sizes Z..160 to Z..225 have a grey cast iron housing with a fitted terminal box. The fan cover is made up of sheet metal.

All motors can also be supplied with gearbox or flange and foot design with shafts largely corresponding to IEC shaft dimensions.

Rating plate for .. 63 A to .. 71 B motors with without brake

The rating plate is fitted on the drive-side motor end shield to the right or left of the terminal box, e.g.

3.2 Brake B.-Motors

Demag B004 to B680 disk brakes are spring-actuated brakes featuring electromagnetic brake release. The brake fitted under the fan cover can be controlled independently of the motor and causes no axial movement of the rotor shaft or forces on the bearings.

The diagram shows the function elements of the disk brake, which is spring-actuated with electromagnetic release. When the power supply to the brake coil is interrupted, the brake is applied. This operating principle is also known as a fail-safe brake.

Brakes B004 to B680 can be released by a rectifier integrated in the terminal box of the motor or by applying DC voltage direct to the brake coil.

Two brake sizes are available for each motor frame size to cover a large brake torque range for various applications.

B004 – B680 DC brakes

41687356.eps

4 Installation

4.1 Checking the condition of the motor

Before installing the motor, check whether it has suffered any damage during transportation or while in storage, such as corrosion, leaks, deformation or breakage.

Do not clean drives with compressed air

4.2 Checking the installation site

The standard drive is suitable for operation in normal industrial conditions. If the ambient temperature, atmosphere or humidity are other than indicated on the rating plate, the motors must only be operated with special equipment or features (see rating plate).

Ambient temperature	**from –10 C to 40 C (18 F to 104 F)**
Installation height	**up to 1000 m (3300 ft) above sea level**

The site at which motors are installed must be designed in such a way that

- air may circulate to allow heat to be exchanged and that warm air is not inducted again immediately,
- no residue from operating processes can accumulate on the motor, fall between the drive elements or damage the sealing ring,
- the rating plate is accessible.

4.3 Motor mounting position

Before installing the motor, check that it will be operated in the mounting position specified on the rating plate.

4.4 Special instructions for installing the motor

If the motor is operated outdoors in vertical mounting position IM V1 or in an inclined mounting position with the shaft facing downwards, it should be protected by a canopy provided by the customer.

For motors with condensation water openings which can be closed with a threaded plug, the drain holes must be arranged at the lowest point of the motor as otherwise water may enter. If the mounting position of the motor is changed and the drain holes are no longer required, the openings must be closed.

4.5 Requirements for connecting the motor

- You must be a trained electrician and familiar with the relevant accident prevention regulations and codes of practise.
- The motor and connecting cable must be disconnected from the supply.
- The frequency and voltage specified on the rating plate must correspond to the line frequency and voltage.

The motor must be connected as described in section 7 **Motor brake connection diagrams** .

To change the direction of rotation of the motor, two of the three phase conductors must be interchanged.

The instructions contained in section 5 Commissioning must be followed

229203k1.p65/1099

5 Commissioning

5.1 Requirements

Before the drive unit is put into service:

- the terminal box be must be closed,
- the fan cover must be fitted,
- the line voltage and frequency specified on the rating plate must match the given power supply,
- the motor must be checked for correct connection (check direction of rotation),
- heat must be able to dissipate (e.g. air vent slits must be free),
- it must be ensured that the drive unit does not constitute a hazard (e.g. no hazards caused by rotating or live parts),
- it must be ensured that there are no other hazard sources.

5.2 Check when commissioning

Check that:

- the motor runs correctly (e.g. no speed fluctuations or excessive noise),
- there is no extreme vibration.

6 Maintenance

6.1 Checking before and during operation

If defects or damage are detected, the motor must not be put into operation or taken out of service. It may only be put back into service when the defect has been eliminated.

Check the motor for

Check		Action
• External damage	→	Inform person responsible
• Unusual noises during operation	→	Inform person responsible
• Dirt accumulation	→	Remove dirt

6.2 Maintenance schedule

Maintenance schedule

Interval	Part	Maintenance	See section
In accordance with the operating conditions, at least every 3000 hours of operation.	Brake	Check brake of motors fitted with brake	6.3 or 6.4
Every 10 000 hours of operation.	Motor	Inspect the motor and clean the cooling air channels	

229203k2.p65/1099

6.3 B004-B680 brakes

The following work may only be carried out by qualified personnel.
Observe relevant safety regulations and codes of practise and the instructions contained in section 1.4 “Safety instructions”.

6.3.1 Measuring the brake displacement

Apart from wear, the brake is virtually maintenance-free. The organic/mineral brake lining is designed in such a way that worn surface particles are only given off as minimal abrasion. This built-in regeneration of the brake lining surface ensures constant braking characteristics. It is advisable to check the brake air gap at certain intervals and to adjust it as necessary to ensure the brake releases reliably. When the brake is released (power applied to brake coil), the brake disk can be freely turned.

Guide values for the air gap and bbraking work until adjustment are contained in the “Brake settings” tables in section 6.4.

Note: It is only possible to give guide values for braking work until adjustment as they depend on the given operating conditions.

When the brake has been adjusted several times, the remaining thickness b_{min} of the brake disk must be checked. The guide pins feature an easily visible marking which clearly indicates the minimum dimension. The brake rotor must be replaced when this mark is exceeded. For this purpose, a maintenance and spare part set is available which not only contains the brake rotor, but also the required small parts and installation instructions.

6.3.2 Ad usting the brake air gap

The air gap must be adjusted when the max. permissible value given in the “Brake settings” tables in section 6.4 has been reached, (however, immediately if the brake no longer releases).

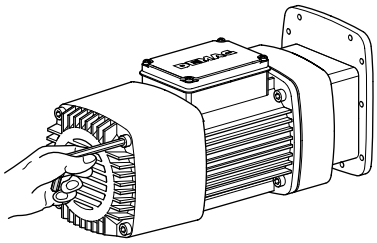
The time to adjust the brake can be determined using the “Adjustment monitoring” option, estimated from the work done by the brake according to the “Brake settings” tables in section 6.4, or established by regular inspections.

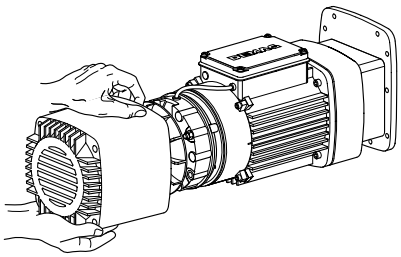
If the brake is not ad usted, it will no longer release after further wear. If the motor then operates against the applied brake, the brake and motor may be damaged and fail.

Condition: Brake and fan cover fully fitted

Tools required:
- Open wrench, feeler gauges, pliers for retaining rings
- Long hexagon socket key

229203k2.p65/1099

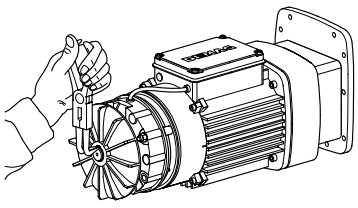


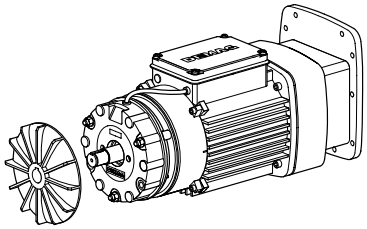


Undo the four screws and remove the fan cover.

41431944.eps

41432044.eps

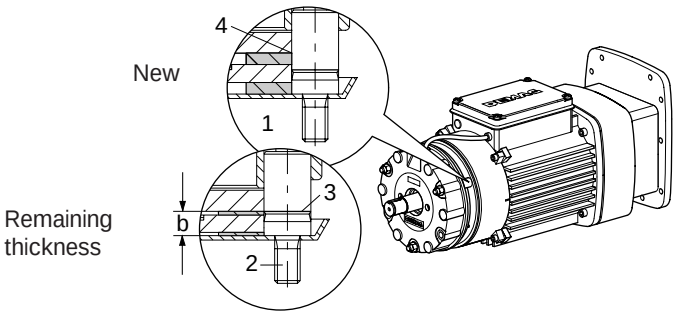




If the adjusting nuts are not accessible, remove the fan.
[For “Sealing arrangement” option, remove the covering tape.]
Remove or suck the loose brake abrasion from the inside of the brake enclosure.
Beware of the dust if the abrasion is blown out of the enclosure.

41432144.eps

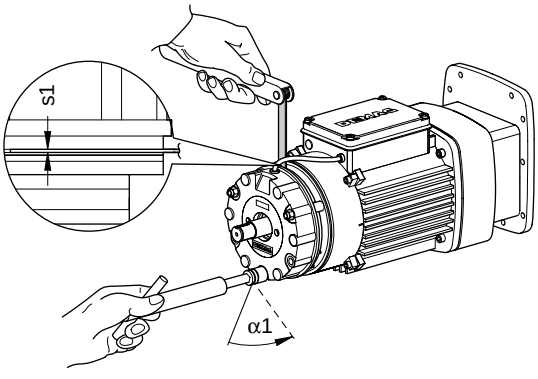
41432244.eps



Check the remaining thickness of the brake disk with friction linings (1). The guide pins (2) feature a mark (3) which the armature disk edge (4) must not cover. If the armature disk edge (4) has reached the mark (3), the brake disk (1) must be replaced.

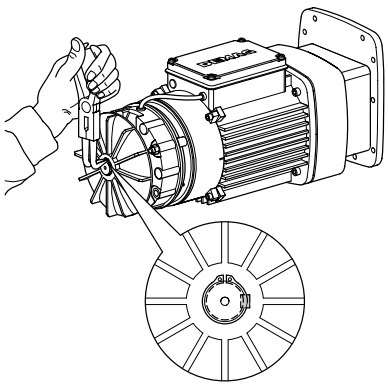
(For instructions refer to section 6.3.3 “Replacing the brake disk”.)

41437955.eps



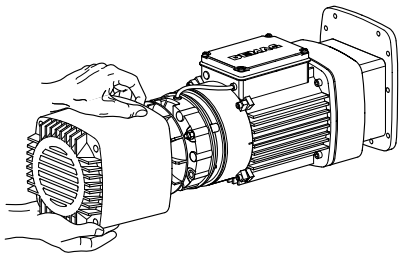
If the remaining thickness of the brake disk (1) is sufficient, adjust the brake as follows:
Tighten the three self-locking nuts uniformly until the air gap is zero. Loosen the nuts by angle α_1 given in the “Brake settings” tables in section 6.4 to set the air gap to s_{1min}.
Check air gap s_1 using a feeler gauge at three points around the circumference (adjust again if necessary).
Note The rotor shaft must be able to turn freely when the brake is released.
Check the brake for correct functioning.

41444245.eps



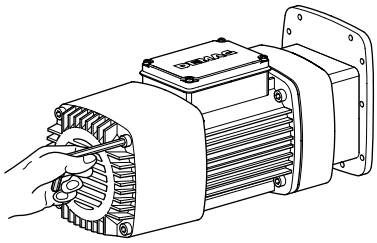
[For “Sealing arrangement” option, replace the covering tape.]
If the fan has been removed: fit the fan and, if applicable, the key.
Secure the fan with the retaining ring. Ensure the retaining ring clicks correctly into place (see diagram).

41433244.eps



Align the fan cover as appropriate for the model.
Secure the fan cover with the four screws.

41432044.eps



41431944.eps

6.3.3 Replacing the brake disk

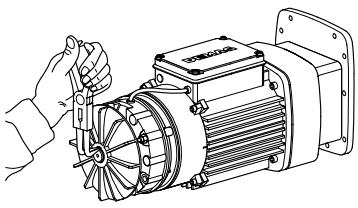
Note: **Damaged brakes may only be repaired by a Mannesmann Dematic authorised workshop.**

To ensure reliable functioning of the brake, the lining must be of a thickness defined as the minimum remaining thickness in the “Brake settings” tables in section 6.4.

The brake disk is a wearing part and must therefore be **replaced** on reaching its minimum thickness. The friction plate and armature disk must be checked and replaced, if necessary.

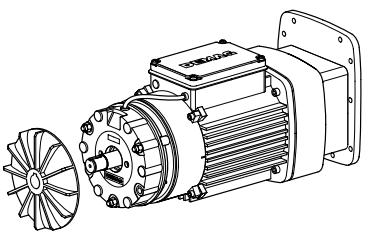
Condition: Fan cover and covering tape (IP 55) removed (see section 6.3.2 “Adjusting the brake air gap”).

Tools required:
- Open wrench, feeler gauges, pliers for retaining rings to DIN 5254
- Long hexagon socket key

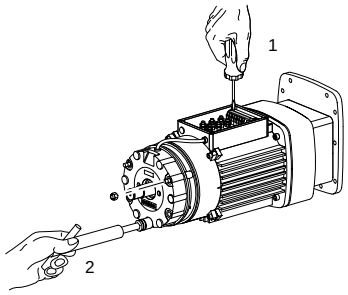


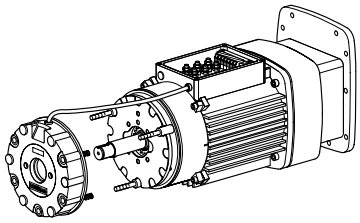
Remove the retaining ring and fan.

41432144.eps



41432244.eps





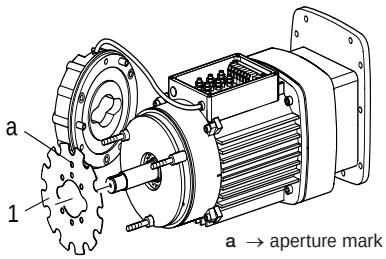
Disconnect the cable for brake coil and microswitch (1), if applicable. Pull the cable out of the terminal box far enough to do the following.

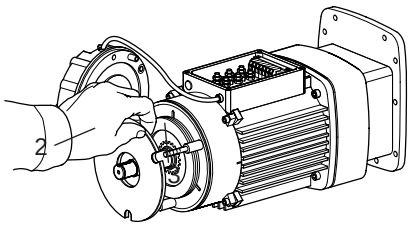
Undo the three self-locking nuts (2) used for adjustment (pay attention to tension of brake and distance springs). The collared pins must not be unscrewed, tighten them to the tightening torque specified in section 6.4 if necessary.

Carefully pull the magnet assembly off the three collared pins and the motor shaft.

For vertical mounting arrangement (brake at the top): fix the brake springs and, if applicable, the plunger (microswitch option) in place with strips of adhesive tape or a rubber band.

41432344.eps 41432444.eps





Remove stop plate (1). Pay attention to the distance springs, these can remain on the collared pins. (Replace the brake springs when changing the brake disk.)

Remove armature disk (2) (both disks for the “Reduced noise level” and “Manual brake release” options) and brake disk (3).

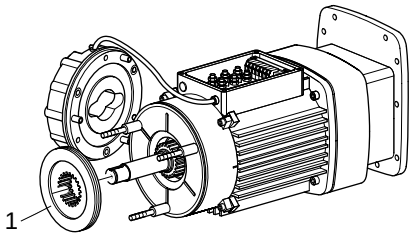
Remove or suck the loose brake abrasion from the inside of the brake enclosure. **Beware of the dust if the abrasion is blown out of the enclosure.**

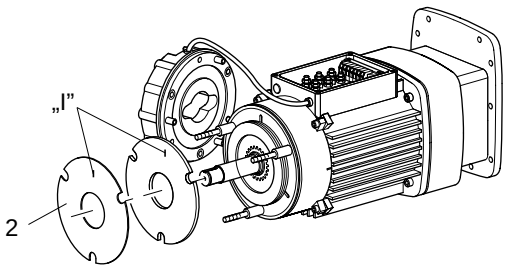
Check the armature disk and the friction plate for damage, excessive scoring or similar, also check the friction plate for deformation and the collared pins for extreme differences in diameter.

Replace worn or damaged parts.

When fitting new collared pins, ensure that the outside diameter is not damaged (use a counter-nut). Also pay attention to the tightening torques given in the tables in section 6.4.

41432544.eps 41432844.eps



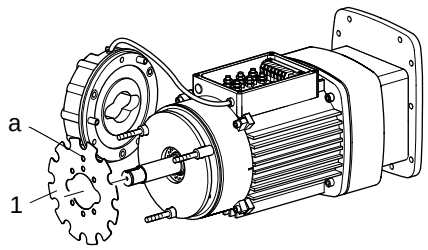


Place brake disk (1) centrally on the carrier. Pay attention to correct alignment and do not use force. Keep the friction surfaces clean (no grease on the friction surfaces) as the initial friction coefficient will otherwise be changed.

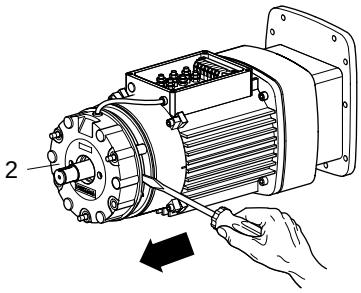
Align armature disk (2) (the thicker disk first for the **Reduced noise level** and **Manual brake release** options) with marker **I** facing the terminal box and then fit the armature disk on the collared pins.

(The motor end shield must first be fitted with the marker in the right position)

41432744.eps 41432655.eps

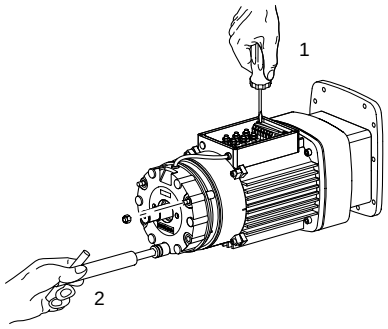


41432544.eps



41433144.eps

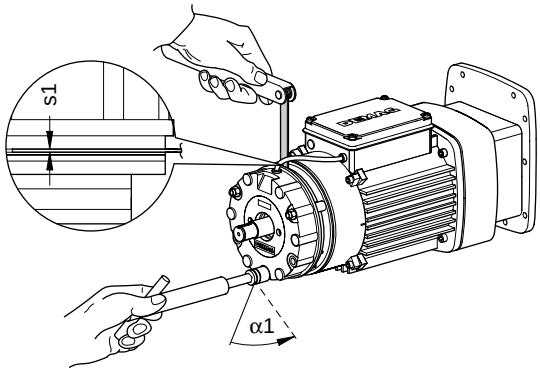
Align stop plate (1) and place it on the collared pins in such a way that aperture mark **a** is facing towards the marker on the end shield. Place the three distance springs on the threaded ends of the collared pins. Fit brake springs symmetrically into the magnet as before or as specified in the “Brake settings” tables in section 6.4. For the vertical mounting arrangement with the brake at the top, prevent the springs from falling out using rubber bands or similar (rubber band grips the outside of the brake springs). Align magnet (2) (with the opening for the operating lever facing towards the marker on the end shield for the Manual brake release option) and push it into place. Fit the self-locking nuts on the collared pins. Ensure the stop plate is guided by the three collared pins and does not get caught in the distance springs before the collared pins engage the magnet.



41432344.eps

Pull the cable back into the terminal box.

Pull the cable back into the terminal box. Connect the cable for the brake coil and, if applicable, microswitch (1).



41444245.eps

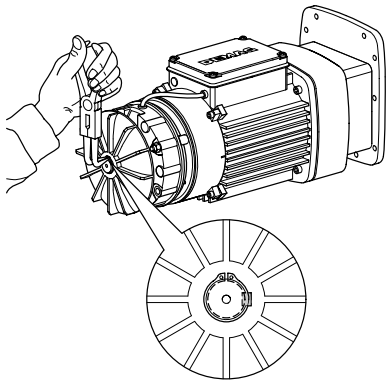
Adjust the brake as follows:

Tighten the three self-locking nuts uniformly until the air gap is zero. Loosen the nuts by angle α_1 given in the “Brake settings” tables in section 6.4 to set the air gap to s_{1min}.

Check air gap s_1 using a feeler gauge at three points around the circumference (adjust again if necessary).

Note The rotor shaft must be able to turn freely when the brake is released.

Check the brake for correct functioning after reconnecting the brake coil.

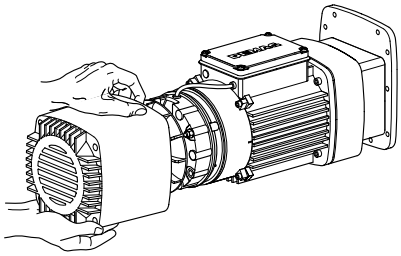


41433244.eps

For “Sealing arrangement” option, replace the covering tape.

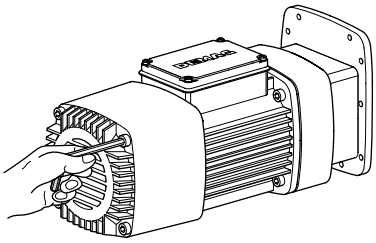
Fit the fan and, if applicable, the key.

Secure the fan with the retaining ring. Ensure the retaining ring clicks correctly into place (see diagram).



Align the fan cover as appropriate for the model.

41432044.eps



Secure the fan cover with the four screws.

41431944.eps

7 Motor brake connecting diagrams

7.1 Brake control

Various control modules are available which are fitted in the brake motor terminal box as standard for controlling Demag B004 to B680 disk brakes with DC magnets. Brakes up to size

- B050 for ZBA motors
- B140 for ZBF motors

featuring **24 V DC coil voltage** can be supplied and controlled by the installation control system.

All rectifiers feature varistor protection against overvoltage at the AC input and on the switching contact terminal as standard. GE, GS and GP brake rectifiers can be used for voltages from 42 V AC to 500 V AC.

GE, GS and GP brake rectifiers can be fed separately with alternating current or connected parallel to the motor winding. AC or DC brake control is possible with all brake rectifiers depending on the connection.

The control system is of modular design. SE or VE modules for fast DC interruption of the brake current can be added to brake motors fitted with GE, GS or GP brake rectifiers, also at a later date, without the need for additional cables and switching devices.

Operation with frequency inverters

If B cylindrical rotor brake motors are operated together with inverters, the brake must be provided with a separate power supply and control.

Brake application times are highly dependent on the way in which the brake is connected.

Supply and brake voltage

U_{line} [AC]	U_{brake} [DC]
240 V and 240/480 V	108 V
480 V	216 V
330/575 V	150 V

Direct DC current supply to brake coil with 24V DC

Direct supply with 24V DC is possible for

- ZBA-motors up to brake size B050
- ZBF-motors up to brake size B140.

A brake control module is not necessary. The brake coil is protected with varistor against overvoltage.

Brake control modules

- **GE brake rectifier (normal excitation)**

  GE half-wave brake rectifiers are used for single-speed motors as standard, and for pole-changing motors featuring separate power supply for brake size
  - B050 for ZBA motors
  - B140 for ZBF motors.

  They mainly consist of a half-wave rectifier with integrated free-wheeling circuit.

Important **When used with a pole-changing motor, the GE module must be provided with a separate power supply or in USA according to diagram 037 980 84 (see section 7.7).**

Note When SE or VE units are used, no additional cables are necessary.

229203k3.p65/1099

GS brake rectifier (high-speed excitation)

GS brake rectifiers are used for motors with brakes as of size B140 as standard. They can be used for single-speed motors as well as for pole-changing motors with a separate power supply. These rectifiers are used to temporally overexcited the brake to relaease it and then to supply it with the appropriate holding voltage.

GS brake rectifiers can be used as an option for brake sizes B004 to B050. This makes it possible to achieve shorter brake release times and higher motor starting frequencies.

Up to brake size B050, two leads are sufficient for control (over-excitation factor of 2), from brake size B140, on three leads are required (over-excitation factor of 2,5).

GS modules include a reversible rectifier which overexcites the brake for approx. 0,3 seconds to release it and then supplies it with the appropriate holding voltage from a half-wave rectifier.

Important **When used with a pole-changing motor, the GS module must be provided with a separate power supply or according to diagrams 037 981 84 and 038 025 84 (see section 7.7).**

Note When SE or VE units are used, no additional cables are necessary.

GP brake rectifiers (normal excitation for pole-changing motors)

GP brake rectifiers can be used as an option for simple control with pole-changing motors together with switch-off in the DC circuit. In contrast to GE rectifiers, no further supply line is required for voltage control.

The motor and brake control module are connected to the same power supply.

Note When SE or VE units are used, no additional cables are necessary.

SE current relays (motor current-dependent high-speed trip relay)

SE current relays can be combined with GE, GS and GP brake rectifiers. They are used for rapid demagnetization of the brake to achieve fast brake application times without the need for additional wiring for brake switch-off in the DC circuit. SE current relays are connected to one motor current phase. When the motor is switched off, the relay demagnetizes the brake by opeining the contact in the DC circuit.

When SE units are used, no additional cables are necessary to interrupt the power supply for the brake.

Important **SE modules must not be used together with inverters. We recommend the use of VE voltage relays for these applications.**

SE current relays can be used for rated motor currents up to 50 A.

VE voltage relays (voltage-dependent high-speed trip relay)

VE voltage relays can be combined with GE, GS and GP brake rectifiers. In contrast to SE current relays, **VE voltage relays must only be used for brakes with a separate power supply**. These modules may preferably be used for inverter-fed motors. They are used for high-speed demagnetization of the brake to achieve fast brake application times without the need for additional wiring for brake switch-off in the DC circuit. VE voltage relays are connected to the brake power supply. The contact in the DC circuit is opened when the brake is switched off.

Brake control module technical data

Module	Ident. no.	Voltage range in V [1]	Max. continous brake direct current A	Remarks	
GE	260 892 84	110 ... 500	1,5

7.2 Brake operating times

Brake application times are highly dependent on the way in which the brake is connected.

- **Direct current connection**

  The coil circuit is interrupted when the brake module contact opens at the relevant terminal. The magnetic field rapidly decreases and the brake torque rapidly rises. Mannesmann Dematic rectifiers are protected against overvoltage at the switching contact by varistors.

  Interruption of the DC circuit between the module and the coil connections is not permitted.

- **Connection in the AC circuit**

  When the brake voltage is switched off, i.e. on the supply side before the rectifier, an inductive coil current continues to flow through the rectifier diodes for a short time. The magnet field decreases more slowly. The braking operation begins more smoothly.

  This connection type is not suitable for hoist drives.

- **Connection in the motor circuit**

  The rectifier is connected directly to the motor terminals. When the motor is switched off, the residual motor voltage results in significantly longer switch-off times compared to switch-off in the AC circuit.

  Unless provided with switch-off in the DC circuit using a contact or the SE current relay, this type of connection is not suitable for drives with overhauling loads, e.g. hoists, and may not be used in these applications.

Depending on the type of connection, the release and braking operation of B004 to B680 DC brakes can generally be characterized by the following values:

- t_{11} Brake release time with normal excitation (GE, GP) [1)]
- t_{12} Brake release time with high-speed excitation (GS) [1)]
- t_{21} Brake application time for switch-off in the AC circuit
- t_{22} Brake application time for switch-off in the DC circuit (contact)
- t_{23} Brake application time for switch-off in the DC circuit (SE, VE)

1) Definition: **Release time is the time it takes to reach the full acceleration torgue of the motor.**

Brake release times may be reduced using high-speed excitation modules with which a higher voltage is temporarily applied to the brake coil when the brake is turned on and the magnetic field is built up more quickly.

7.2.1 BA range brake operating times

Table 9

Si e	Release times in ms		Application times in ms		
	t_{11}	t_{12}	t_{21}	t_{22}	t_{23}
B004	60	35	250	55	85
B007	120	60	90	30	60
B020	130	90	40	20	30
B050	120	100	90	30	80
B140	–	110	60	30	60
B280	–	140	300	90	160
B680	–	140	300	150	225

The brake release and application times given are guide values for the maximum brake torque. In the case of lower brake torques, these values may change, particularly t_{21} for switch-off in the AC circuit.

229203k3.p65/1099

7.2.2 BF range brake operating times

Table 10	Si e	Release times in ms		Application times in ms		
		t_{11}	t_{12}	t_{21}	t_{22}	t_{23}
	B004	60	40	200	30	40
	B020	60	40	300	50	60
	B050	80	65	300	60	70
	B140	110	90	350	100	100

The brake release and application times given are guide values for the maximum brake torque (see table 10). In the case of lower brake torques, these values may change, particularly t_{21} for switch-off in the AC circuit.

7.3 Selection criteria

The following criteria must be considered when selecting the connection diagram:

- **Motor for use in USA or Canada**
- **Motor for inverter operation if applicable**
- **Brake motor or motor without brake**
- **Motor to be operated with**
  - one line voltage, e.g. 240, 480, 575 V, 60 Hz or
  - two line voltages,e.g. - USA: YY/Y 240/480 V, 60 Hz
    - Canada: Δ/Y 330/575 V, 60 Hz.
- **Motor designed for one or two speeds**
- **Common or separate power supply to motor and brake**
- **Control module selected**
  - GE for normal excitation
  - GS for high-speed excitation
  - GP for normal excitation for pole-changing motors
- **Switch-off**
  - in the DC circuit for short operating times (e.g. hoist drives, positioning drives
  - in the AC circuit for medium operating times (e.g. travel drives, conveyor belts)
  - in the motor circuit for stopping the motor in an uncritical time.

Refer to the following flow charts.

Notes

- The motor and brake of inverter-fed drives must have **separate** power supplies.
- **SE modules** must **not** be used with inverter-fed drives.
- **GE**, **GS** or **GP application** for a maximum voltage of **500 V**.
- **Connection diagrams**
  - Connection diagram selection (flow chart) for line-fed drives in USA and related tables → section 7.4.
  - Connection diagram selection (flow chart) for line-fed drives in Canada and related tables → section 7.5.
  - Connection diagram selection (flow chart) for inverter-fed drives and related tables → section 7.6.
  - Connection diagrams→ section 7.7.
    Diagrams shown in numerical order according to ident. no.
  - Connection diagrams arranged in the motor terminal box.
- **Condition when supplied for inverter operation**
  When motors are supplied for **INVERTER OPERATION**, **GE** or **GS** brake control modules are **NOT** connected with the motor winding as shown in the individual connection diagrams which document the motor connection on delivery.
  The brake control module must be provided with a **separate AC power supply**.

7.8 Connecting temperature and brake monitoring devices

Depending on the motor features, the connections for temperature monitoring and/or brake monitoring are brought out on Euro terminals in the terminal box.

The following connection designations are used:

PTC thermistor

– Switch-off: **P1 - P2** and **P21 - P22**
– Warning: **P11 - P12**

Important PTC thermistors to DIN 44081 are suitable for tripping devices with 2.5 V DC output voltage and 4 kΩ tripping resistance.
PTC thermistors may only be continuity tested with max. 2.5 V DC. Do not use a buzzer (voltage peaks) or similar devices. The resistance of **one** PTC thermistor is 20 ... 250 Ω at temperatures of –20 °C to ϑ_{TNF} – 20K. (TNF = rated operating temperature).

Temperature detector (bimetallic switch) **P1 – P2**

Brake monitoring

– Release monitoring: **801 – 802 – 803**
Contact 2 (802 – 803) closed:
Brake not released, brake in applied position
Contact 4 (801 – 803) closed:
Brake released

– Adjustment monitoring: **804 – 805 – 806**
Contact 2 (805 – 806) closed:
Brake must be adjusted
Contact 4 (804 – 806) closed:
Normal operating condition

The diagrams below show the most important single connections.
When several monitoring devices are used (such as temperature detectors for the motor and release monitoring for the brake), the individual circuits are combined in one connection diagram which can be found inside the motor terminal box.

8 Technical data

Function conditions for standard design			
Conditions		**range**	
Transport temperature		–20 ... +40°C (–4 to +104°F)	
Storage temperature		0 ... +40°C (+32 to +104°F)	
Storage conditions		Dry, indoors	
Ambient operating temperature		–20 ... +40°C (–4 to +104°F)	
Environment		Acid-free	
Coolant		Air	
Coolant temperature		max. +40°C (+104°F)	
Temperature rise limit of winding		105 K	
Installation site height		max. 1000 m (3300 ft) above sea level	
Air circuit		Ensure by working clearance, unrestricted air intake	
Enclosure		IP 54	
Mounting arrangement		Low vibration	
Working clearance at fan end		150 mm (5.91 in) at rear	
Line voltage	USA:	480 V 60 Hz (two speeds)	240/480 V 60 Hz (one speed)
	Canada:	575 V 60 Hz (two speeds)	330/575 V 60 Hz (one speed)
Voltage tolerance		±10% of the line voltage	
Max. speed		3600 rpm	

9 Troubleshooting

Pos.	Problem	Possible cause	Solution
1	Motor does not start.	Fuse has tripped.	Replace fuse.
		Power supply line interrupted	Check connections.
		Motor protection has tripped.	Check motor protection for correct setting.
		Control defective.	Check motor connection.
		Brake does not release.	See section 9 **Brake does not release**
2	Motor does not start or starts slowly.	USA: Motor for YY connection connected in star	Correct motor connection.
		Canada: Motor for Δ connection connected in star	
		Extreme voltage or frequency deviation from setpoint value.	Improve quality of power supply; check power supply line cross-section.
3	Motor runs in wrong direction.	Motor incorrectly connected.	Interchange two supply leads.
4	Motor hums and has high power consumption.	Winding defective.	Motor must be sent to specialist workshop for repair.
5	Fuses trip or motor protection trips immediately.	Short-circuit in the supply line.	Eliminate short-circuit.
		Short-circuit in the motor.	Motor must be sent to specialist workshop for repair.
		Power supply cable incorrectly connected.	Correct connection.
		Short-circuit to ground in the motor.	Motor must be sent to specialist workshop for repair.
6	Extreme loss of speed under load.	Overload.	Measure power, use larger motor or reduce load, if necessary.
		Voltage drop.	Increase power supply line cross section.
7	Excessive motor temperature rise (measure temperature).	Overload.	Measure power, use larger motor or reduce load, if necessary.
		Insufficient cooling.	Correct cooling air circulation or clear air circulation channels, fit separate fan, if necessary.
		Separate fan not running.	Check connection, correct if necessary.
		Ambient temperature too high.	Reduce power, use larger motor, if necessary
		USA: YY connection instead of star connection as specified.	Correct connection.
		Canada: Δ connection instead of star connection as specified.	
		Temporary two-phase operation.	Intermittent electrical contact in the power supply line.
		Fuse has tripped.	Replace fuse.
		Mains voltage differs from the rated motor voltage by more than 10%. Higher voltages are particularly unfavourable for low-speed motors as their no-load current is close to the rated current even at normal voltage.	Match motor to power supply voltage.
		Duty type exceeded, e.g. starting frequency too high.	Adapt operating conditions to corresponding motor duty type.
8	Excessive noise.	Friction bearing distorted, dirty or damaged.	Realign motor, inspect friction bearings, replace if necessary.
		Rotating parts vibrating.	Correct any imbalance.
		Foreign bodies in cooling air circuit.	Clean cooling air circuit.
9	Brake does not release	Incorrect voltage applied to brake control unit.	Apply correct voltage (see rating plate).
		Brake control unit failure.	Change brake control unit, check brake coil (resistance), check switchgear.
		Max. permissible air gap exceeded because the brake lining is worn out.	Adjust the brake (replace the complete brake lining carrier if the lining is worn out).
		Voltage drop in the power supply line > 10 %.	Ensure correct supply voltage is applied.
		Brake coil short-circuit with the winding or housing.	Change complete brake with control unit (specialist workshop), check switchgear.
10	Motor does not brake.	Brake lining worn out.	Replace the complete brake lining carrier
		Manual brake release device incorrectly adjusted.	Set adjusting nuts to correct setting.
		Manual brake release device locked.	Release lock, remove lever.
		Incorrect brake torque.	Change brake torque.

0 Foreword

You have purchased a Mannesmann Dematic product. This equipment was manufactured in accordance with state-of-the-art engineering principles.

These operating instructions are designed to provide the operator with appropriate instructions for safe and correct operation and to facilitate maintenance.

Every individual given the task of transporting, installing, commissioning, operating, maintaining and repairing our DRS wheel block system and additional equipment must have read and understood

- the operating instructions
- the safety regulations and
- safety instructions in the individual chapters and sections.

The operating instructions must be available to the operating personnel at all times in order to prevent operating errors and to ensure smooth and trouble-free operation of our products.

0.1 Copyright

These operating instructions must be treated confidentially. They should only be used by authorized personnel. They may only be entrusted or made available to third parties with the prior written consent of Mannesmann Dematic. All documents are protected within the sense of copyright law.

No part of this documentation may be reproduced, utilized or transmitted without specific prior consent. Infringements are an offence resulting in obligatory compensatory damages. All industrial rights reserved.

0.2 After-sales service

For technical information on Mannesmann Dematic products and their systematic application, please refer to one of our after-sales service stations, the relevant representative or to our main office in Wetter.

0.3 Guarantee

These operating instructions must be read carefully before installing and putting the product into operation.

We assume no liability for damage and malfunctions resulting from failure to comply with the operating instructions.

Wearing parts are not subject to the guarantee, guarantee claims must be made by quoting the order number to Mannesmann Dematic immediately on detecting the defect.

The guarantee is cancelled, for example, in the event of:

- inappropriate use,
- faulty devices or equipment connected or attached to the product which are not part of our scope of supplies and services,
- use of non-genuine spare parts and accessories,
- refurbishment or modification of the product unless approved in writing by Mannesmann Dematic.

0.4 Limitations of liability

All technical information, data and instructions for operation contained in these operating instructions were up-to-date on going to print and are compiled on the basis of our experience and to the best of our knowledge.

We reserve the right to incorporate technical modifications within the scope of further development of the hoist units which are the subject of these operating instructions. The information, illustrations and descriptions contained in these operating instructions are therefore only intended for information purposes.

The descriptions and illustrations contained in this documentation do not necessarily correspond to the scope of delivery or any subsequent spare part delivery, either; the drawings and illustrations are not to scale.

Only documentation belonging to the actual order is valid.

We assume no liability for defects, damage and malfunctions caused as a result of operating errors, noncompliance with these operating instructions or omitted and/or inappropriate repairs and maintenance.

We expressly point out that only Mannesmann Dematic spare parts and accessories approved by us may be used. Accordingly, this also applies to other manufacturers' parts supplied by us.

For safety reasons, the fitting and use of spare parts or accessories which have not been approved and unauthorized modification and conversion of the hoist unit are not permitted; we assume no liability for defects or damages resulting therefrom.

With the exclusion of any further claims, our warranty and liability obligations for any defects pertaining to the products supplied or faults in the documentation delivered or any negligence on our part are exclusively based on the stipulations of the original contract. Any further claims, in particular any and all claims for damages, are excluded with the exception of legal claims in accordance with product liability legislation.

0.5 Definitions

Owner

Owners (employer, company) are defined as persons who own the product and who use it appropriately or allow it to be operated by suitable persons.

Operating personnel

Operating personnel are defined as persons assigned by the owner of the product to carry out special tasks such as installation, operation, setting-up, maintenance including cleaning, fault elimination and transportation of the product.

Specialist personnel

Specialist personnel are defined as persons assigned by the owner to carry out specific tasks.

- **ualified personnel**

  Qualified personnel are defined as persons, who, owing to their technical training, knowledge and experience as well as knowledge of the relevant standards, are able to assess the tasks given to them and identify potential hazards.

- **Trained person**

  Trained persons are defined as persons who have been instructed and trained for the tasks assigned to them and on the possible hazards resulting from incorrect handling and who have been informed about the required protective devices, protective measures, relevant regulations, codes of practice, accident prevention regulations and operating conditions and who have proven their qualifications.

- **Experienced technician**

  Experienced technicians are defined as persons, who, owing to their technical training and experience, have sufficient knowledge of the product and are familiar with the relevant national industrial safety regulations, codes of practice, accident prevention regulations, directives and generally accepted engineering standards (e.g. EC Directives, German VDE and VBG regulations) enabling them to judge the safe operating condition of the DRS wheel block system.

1 Safety

1.1 Symbols

The following symbols and recommendations indicate potential safety hazards or causes of damage:

a ard warning

This symbol appears in the operating instructions next to all instructions relating to safety at work wherever a potential hazard to life and limb exists if the instructions are not complied with.

Follow these instructions at all times and be particularly careful and cautious.

Pass on safety instructions to all persons entrusted with working on the product including the power supply.

In addition to the safety instructions, observe all general safety regulations and codes of practise at all times.

Warning against electrical ha ards

Contact with live parts (e.g. motors connected to the wheel block) can result in immediate death. Protective covers (e.g. covers and enclosures) marked with this sign may only be opened by **qualified electricians**. Before opening, all relevant operating, control, feed or other voltages must be disconnected.

Operating ha ard for the installation

This symbol in the operating instructions indicates all warnings which, if not complied with, may result in damage to the product, the installation or the goods to be transported.

1.2 Intended use

Demag DRS wheel blocks are complete travel units for materials handling installations and general engineering applications, designed for moving loads over a wide range of speeds. They feature prepared connecting surfaces and are ready for fitting to adjoining structures.

The relevant engineering guidelines must be observed when specifying the design.. Refer to the **Demag DRS wheel block system** catalogue, ident. no. 203 352 44 (volume 1) and 203 355 44 (volume 2).

1.3 Prohibited practises, improper use

Under certain conditions, operation of the DRS wheel block system is prohibited as this could result in malfunctions, equipment failure or hazard to life and limb, e.g. in the case of:

1.3.1 Design limits

- Exceeding permissible loads
- Exceeding the design service life
- Occurrence of peak loads which were not considered in the design

1.3.2 Assembly

- Use of connecting elements not designed for use with the wheel block
- Use of non-genuine Demag parts
- Not complying with the assembly instructions
- Tightening bolted connections without using a torque wrench
- Incomplete assembly of connecting elements

Note: Safety measures must not be rendered inoperative or modified or used contrary to the purposes for which they are intended.

1.3.3 Influence of the environment

- Acidic, corrosive air as coolant
- Explosion hazard atmospheres
- Operation outside the permissible temperature range
- Operation under prohibited ambient conditions

Note: Measures must be taken to ensure the travel wheels do not freeze up under conditions of high humidity and low temperatures.

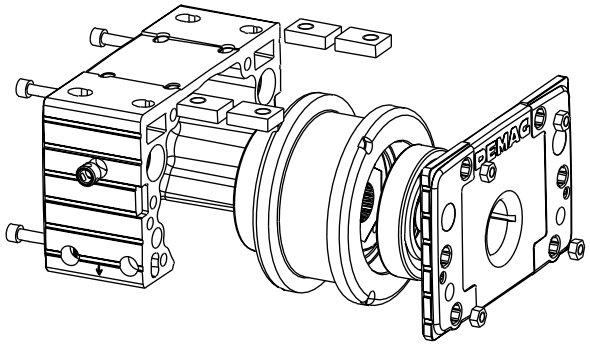
1.3.4 Maintenance

- Exceeding the design service life

214276K1.p65/1098

2 Brief technical description

2.1 Overview



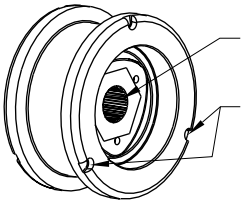
41621344.eps

The Demag DRS 112 to 200 wheel block system, suitable for loads up to 10,000 kg, is a concept designed to meet customer wishes.

The advantages of the system are:

- Most favourable ground clearance conditions with Demag offset gearboxes.
- Robust aluminium housing with very good shape and position tolerances.
- Variable basic design by fitting various travel wheel materials and shapes.
- Weather-resistant due to surface powder coating (see section 2.4).
- Travel wheel and friction bearing can be disassembled with the housing still connected to the support structure.
- High availability owing to generously dimensioned bearings.
- Minimum maintenance due to bearings lubricated for life.
- High installation availability since the housing does not necessarily need to be removed to replace the travel wheel. Not having to realign the housing saves time.

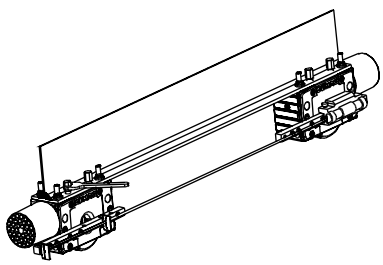
Flange wear indicator



41641055.eps

The flange wear indicator facilitates preventive maintenance without any hazard to the installation.

Alignment



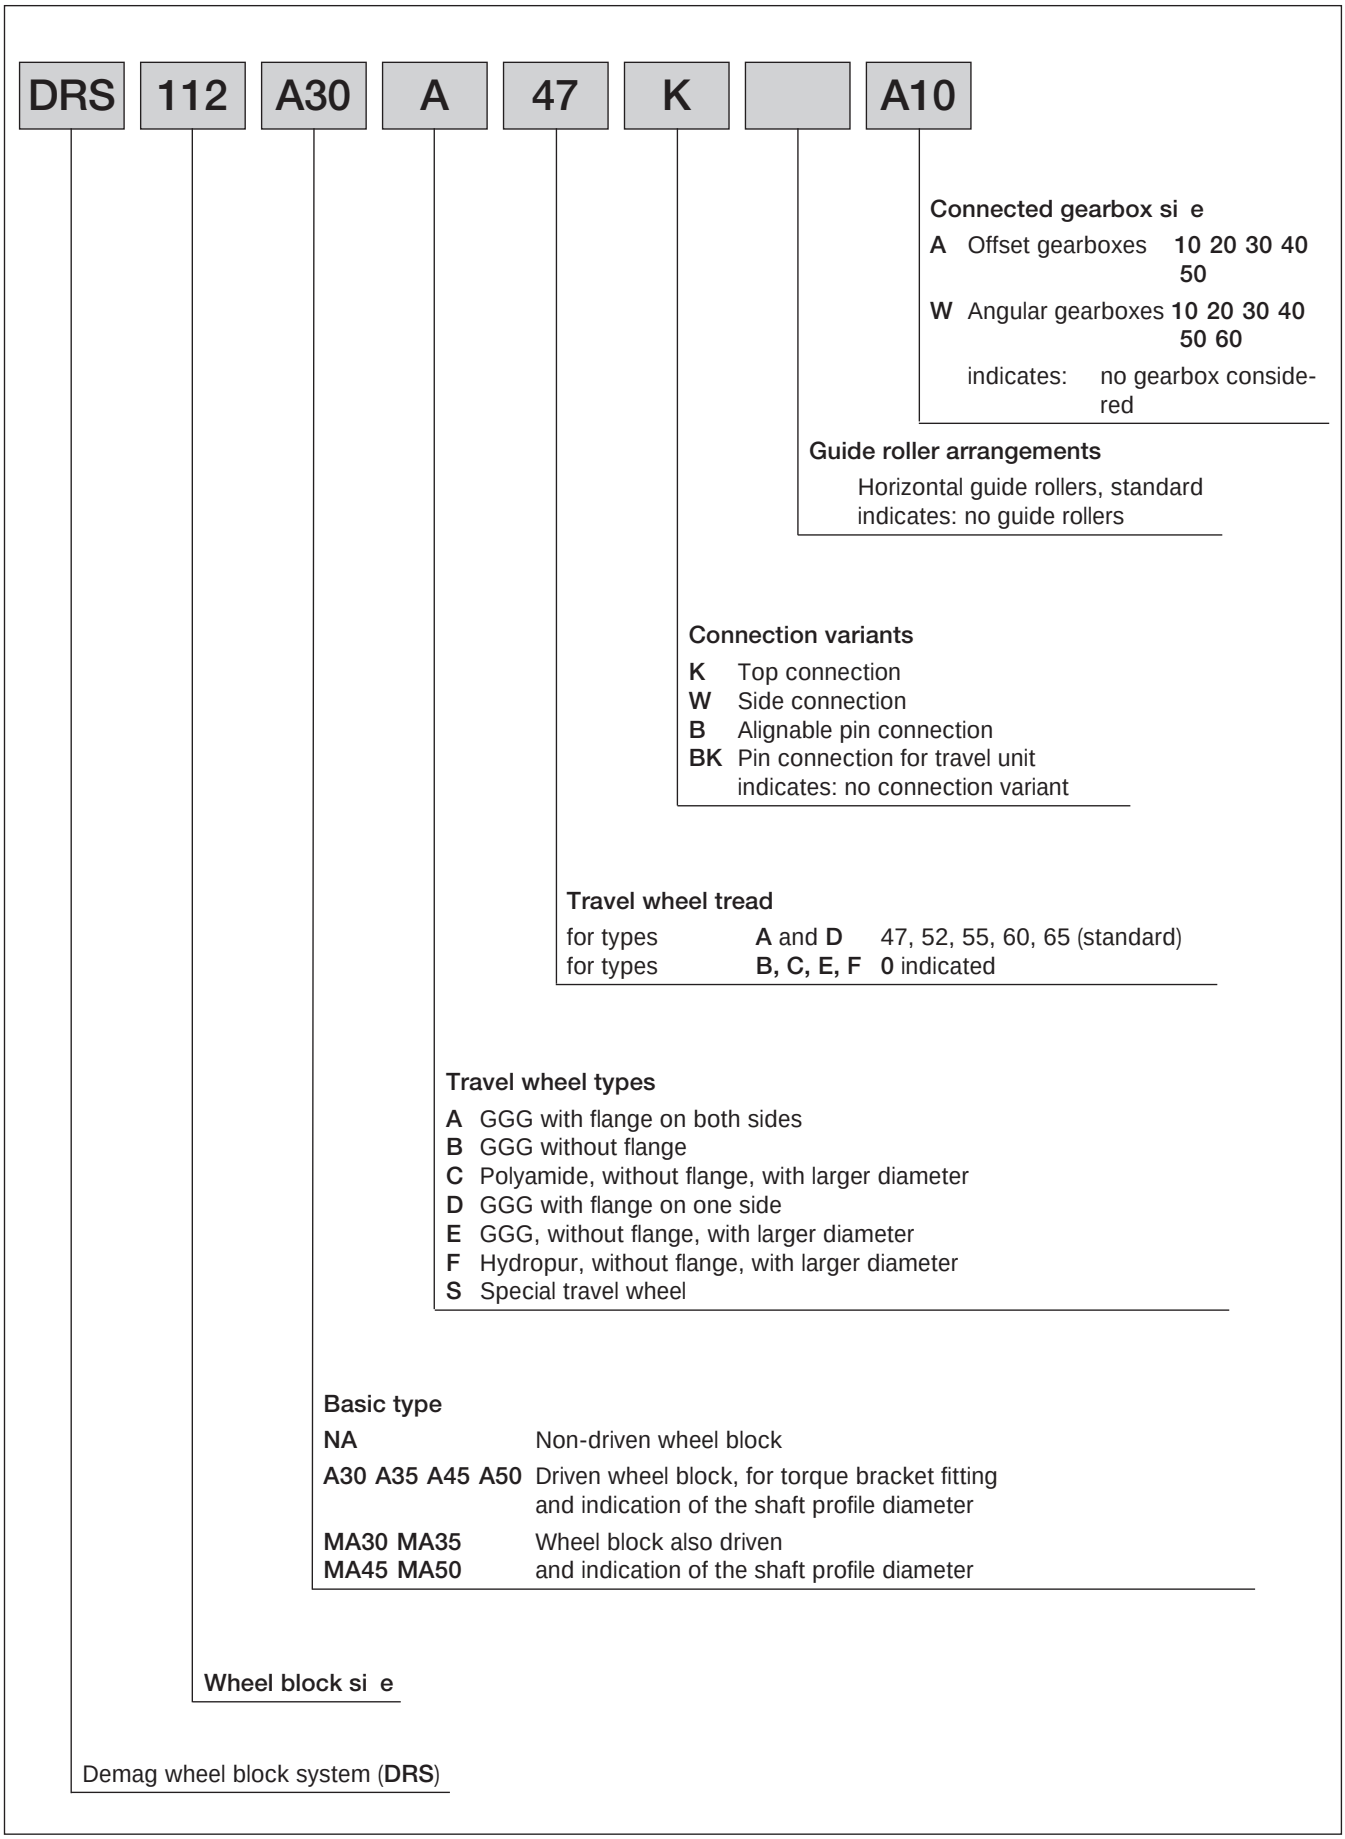
41621255.eps

Fast and optimum alignment of wheel blocks using the Demag alignment device with sliding nuts and prepared connection openings in the wheel block housing.

- Only well aligned wheels reduce wear to a minimum.
- Sliding nut arrangement, used for alignment, offers a lateral alignment path of ± 3 mm.

  Achievable accuracy: 1,6 ‰.

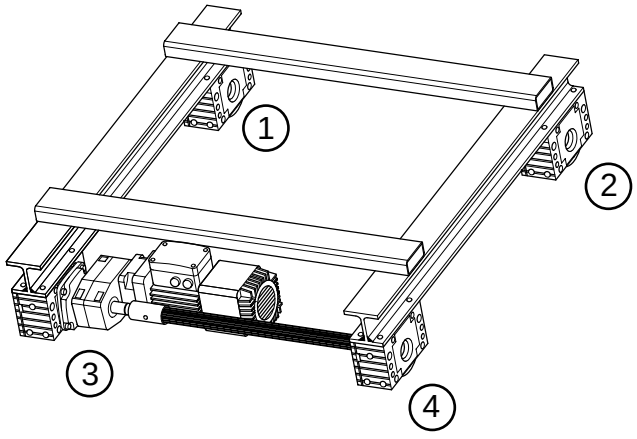
2.2 Type designation key (example) for basic wheel blocks



214276K1.p65/1098

Example for using the type designation key

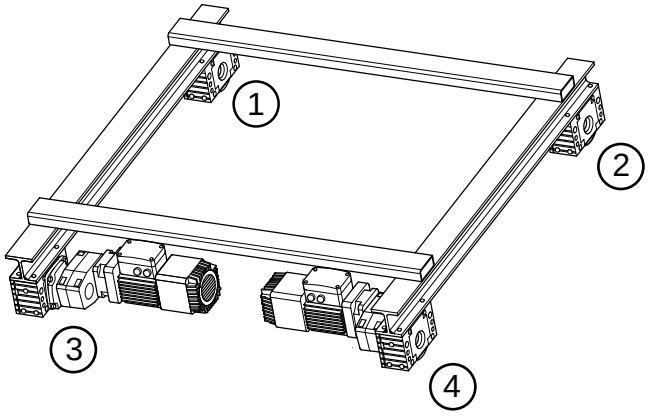
Travel carriage with 4 wheel blocks and a central drive unit



41239655.eps

① DRS125-NA-A-47-K- -
② DRS125-NA-A-47-K- -
③ DRS125-A35-A-47-K- -A20
④ DRS125-MA35-A-47-K- -

Travel carriage with 4 wheel blocks and 2 individual drive units

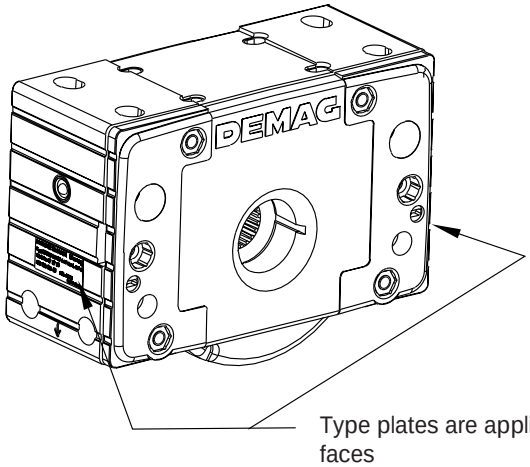


41641155.eps

① DRS125-NA-A-47-K- -
② DRS125-NA-A-47-K- -
③ DRS125-A47-A-47-K- -A20
④ DRS125-A47-A-47-K- -A20

2.3 Type plate

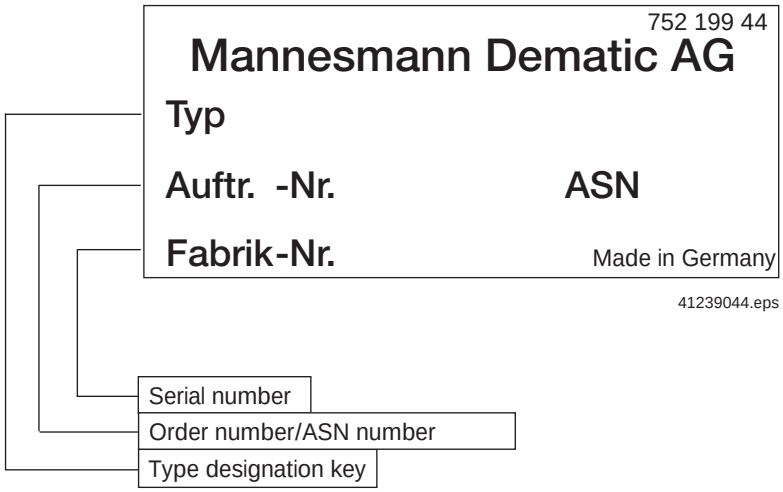
A type plate is applied to each of the end faces of DRS wheel blocks to identify the unit for possible spare part orders.



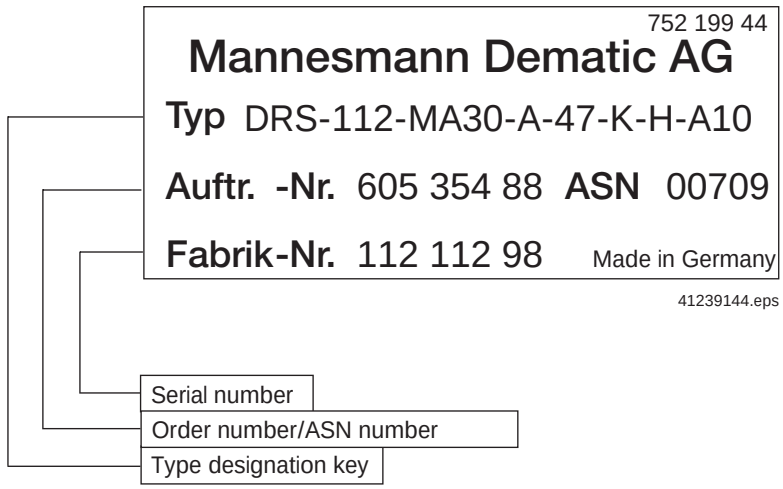
41239344.eps

The type plate may be covered by buffer or guide roller assemblies on one side depending on the design of the wheel block. In this case, the information can be read off the second type plate or relevant fittings can be relatively easily disassembled.

Forms for type plates and type designation keys can be found in section 9 for use in your documentation. Fill in the data of the wheel blocks used in your installation.



Example



2.4 Paint finish

The aluminium wheel block housings are provided with a weather-resistant powder coating in RAL 7001 (silver grey) with a minimum thickness of 90 µm before leaving the factory.

A uniform coating quality is ensured by a works standard oriented to meet wheel block housing requirements (ident no. 012 326 99).

For special paint finishes, wheel blocks can be supplied with a dual component PUR finish coat at the request of the customer.

If the paint finish is to be applied by the customer, attention must be paid to works standard for special paint finish on powder-coated wheel block surfaces (ident no. 012 327 99).

3 Receiving and storage

3.1 Checking goods on receiving

- The scope of delivery is specified in the shipping papers.
- Check the delivery **immediately** on receipt to ensure that it is complete and examine it for damage caused in transit.
- In any case, leave the goods and the packaging material unchanged. Do not use the goods yet!
- Report the damage to the forwarding agent and request the required papers as listed below!
- Then contact the supplier!
- Never return the damaged goods prior to agreement with the supplier!

For transport outside Germany, the relevant country-specific conditions have to be adhered to.

3.2 Transport

The wheel block is supplied made up into one unit. Additional equipment may be supplied in separate packaging.

The wheel block is packed depending on the transport method and its weight. Unless otherwise agreed in the purchase contract, the packaging corresponds to the packaging guidelines of Mannesmann Dematic AG, ident no. 236 070 44.

Symbols used on the packing

412 83944 - 41284644.eps

Handle wheel block units with utmost care to avoid damage caused by careless loading and unloading, for example.

3.3 Storage

Wheel blocks must be stored in dry places which are not subject to extreme temperature fluctuations, e.g. on a wooden support.

Unpacked wheel blocks must not be stacked on top of each other.

Note: **Do not damage the paint finish.**
Mechanical (scratches), chemical (acid, alkaline) or thermal (sparks, welding beads, heat) damage will result in corrosion and failure of the exterior protection.

4 Assembly and alignment

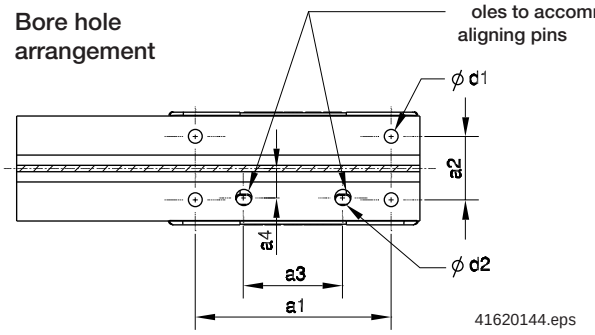
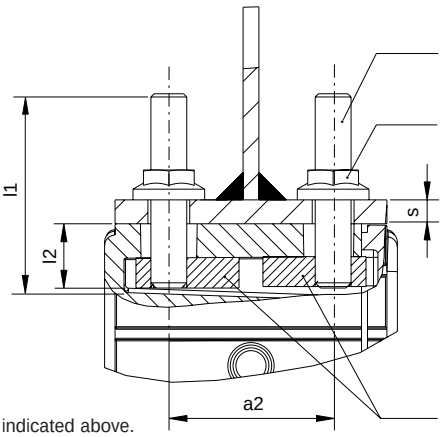
41620355.eps

Bore hole arrangement



41620144.eps

Detail



41620555.eps

Tool

Torque wrench, ring type
Hexagon socket screw key

Preparation

- Drill bore holes in connecting structure according to bore hole pattern indicated above.
- The bore holes to accommodate the eccentric aligning arrangement are only required in connection with the aligning device, part no. 752 100 44 (see section 4.4 **Alignment**).

Assembly

- Screw the threaded pins by hand into the sliding nuts already fitted in the factory until they stop, and then screw them back out by a quarter of a turn.
- Fit and tighten the locknuts by hand (counter by holding the threaded pin). Then position and align the wheel block (see section 4.4 **Alignment**).
- Counter the threaded pins (by holding in place using the hexagon socket at the end of the pin) and tighten the locknuts with the corresponding tightening torque (see table below).
- After fitting, close all unused through holes with the plastic plugs included in the supply.

214276K2.p65/1098

Tools

Torque wrench, hexagon socket key

Preparation

Drill holes (bore holes must be free of paint) in the connecting structure (hollow profile section or similar) according to the above bore hole pattern taking the basic types into consideration.

Assembly

- Fit the wheel block into the prepared hollow profile section and connect with the pin.
- Fit the retaining rings and thrust washers included in the supply to secure against axial movement and to fix the connecting pin in position free of play.
- Adjust the track gauge dimension by screwing the threaded pins into the hollow profile section above the connecting pin.
- Secure the threaded pins using the locknuts.
- Fit the geared motor unit (with torque bracket fitted as in section 5) by bolting the complete drive to the hollow profile section using the locking bolts included in the scope of supply.

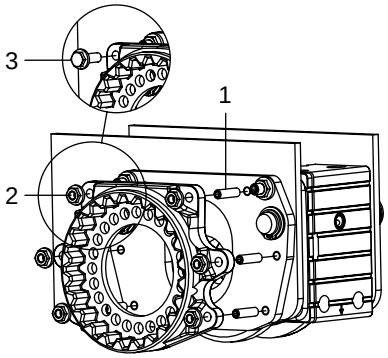
Tools

Torque wrench, hexagon socket key

Preparation

Drill holes (bore holes must be free of paint) in the connecting structure (hollow profile section or similar) according to the above bore hole pattern taking the basic types (NA, A, MA, MAD) into consideration.

Assembly



for • DRS 112/125 threaded pin (1) + locknut (2)
• DRS 160/200 locking bolt (3)

41644544.eps

- Fit the wheel block into the prepared hollow profile section and connect with the pin.
- Place the welding plate on the correspondingly drilled side.
- Fit the retaining rings and thrust washers included in the supply to secure against axial movement and to fix the connecting pin in position free of play.
- Align the wheel block.
- Tack the welding plate to fix it in position and then weld according to the welding instructions (fig. 1).
- Adjust the track gauge dimension by screwing threaded pins (1) into the hollow profile section above the connecting pin.
- Secure threaded pins (1) using locknuts (1).
- Fit the geared motor unit (with torque bracket fitted as in section 5) by bolting the complete drive to the welded plate using threaded pins (1) with locknuts (2) for DRS 112/125 and locking bolts (3) for DRS 160/200.

4.4 Alignment for top connection

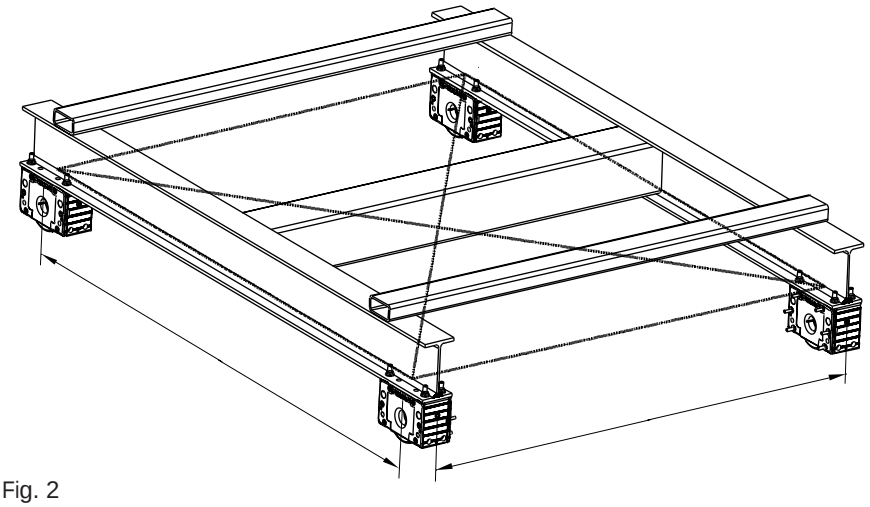

Fig. 2

41642644.eps

Wheel blocks must be precisely aligned to prevent bearing damage and, therefore, premature travel wheel wear.

Make up the frame (frame assemblies) or the support superstructure and roughly align them with the DRS mounting positions. Use the arrow markers on the wheel block end faces.

Example for aligning a travel carriage.

Installation set

41620744.tif

A laser measuring device is available for aligning.

Part no.: **752 100 44**

Refer to figs 3 – 9 on the following pages for use of the laser measuring device.

Contents of the installation set

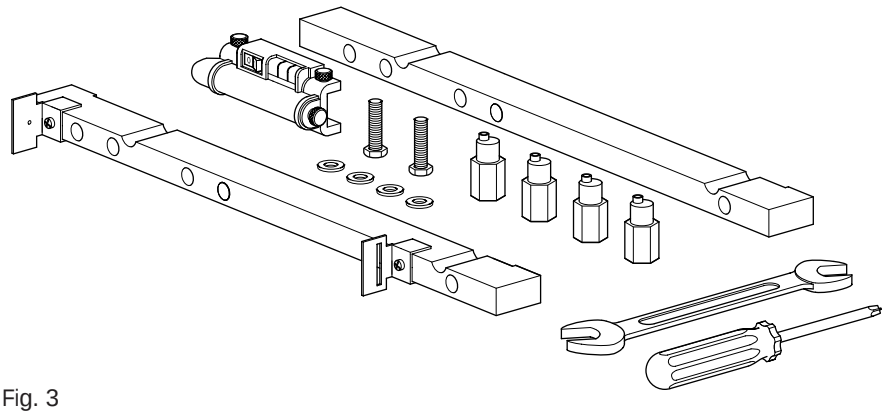

Fig. 3

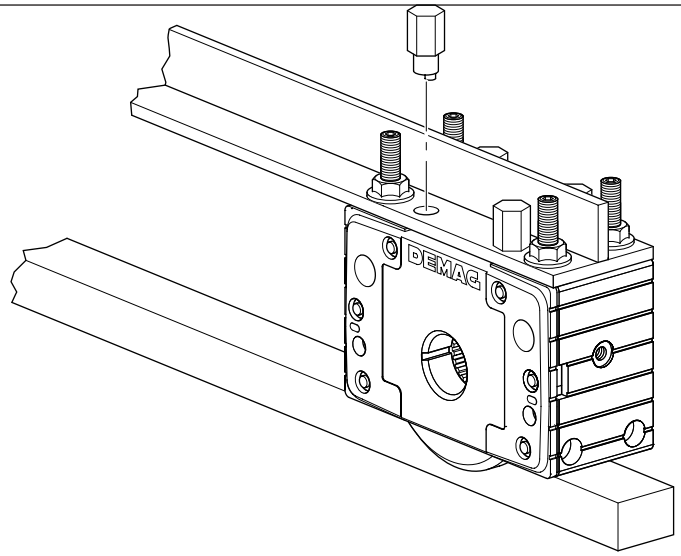
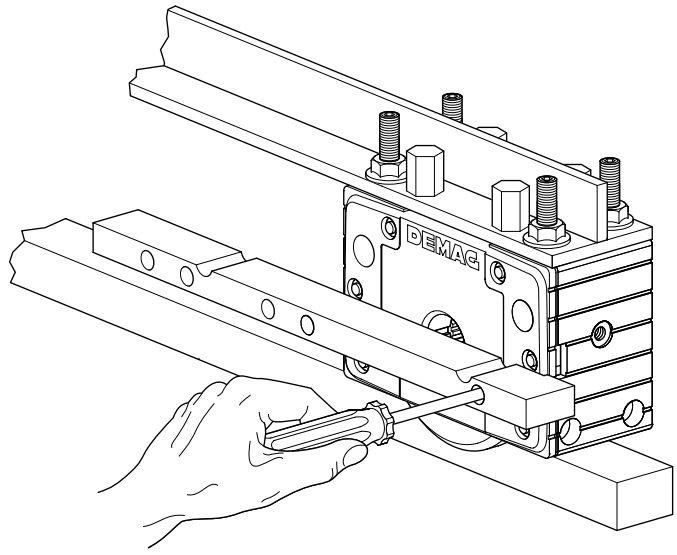
41444355.eps



Fit the aligning pin. There must be no load acting on the wheel blocks and the wheel blocks must be bolted to the travel carriage with the connections tightened only by hand.

Fig. 4

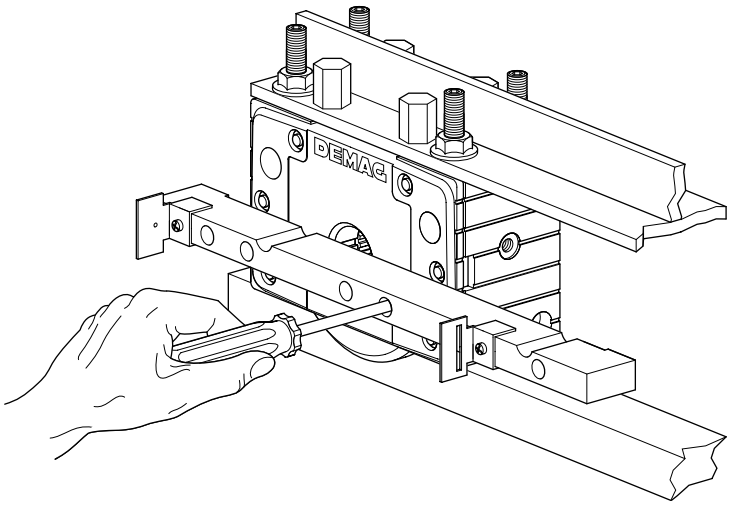
41444444.eps



Fit the rail for the laser unit to the first wheel block.

Fig. 5

41444544.eps



Fit the rail with the slot aperture and target marker to the second wheel block.

Fig. 6

41444644.eps

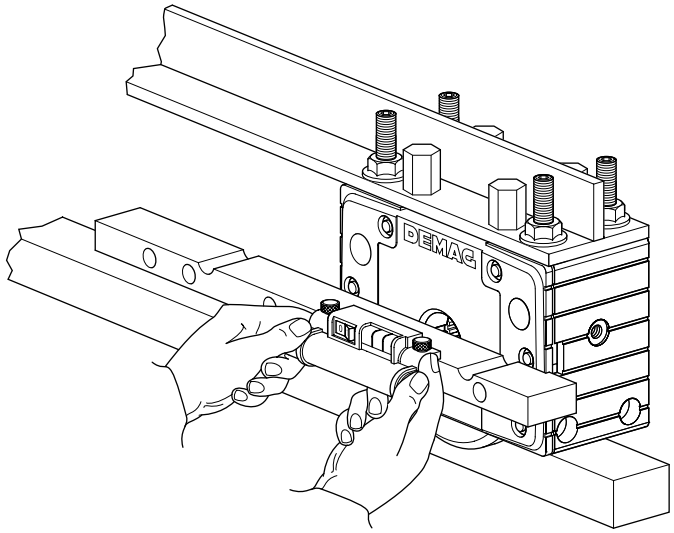


Fig. 7

41444744.eps

Put the laser on the rail in the centre of the wheel block. Then turn on the laser.

Safety note:

Pay attention to the laser unit operating instructions.

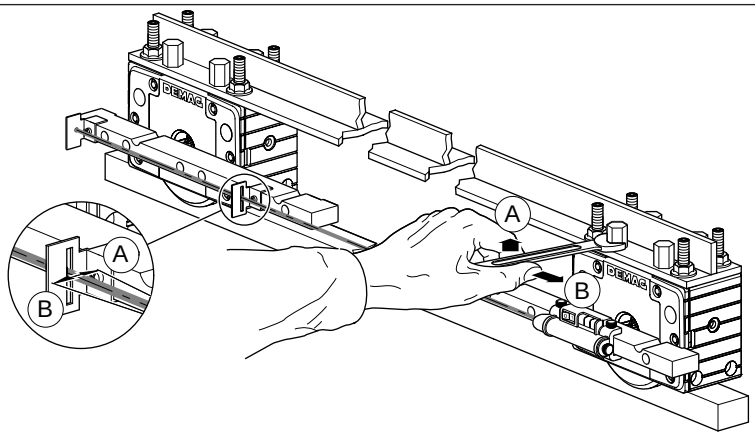

Fig. 8

41445144.eps

Align the wheel blocks using the wrench and the aligning pin. First roughly align the wheel blocks by hand so that the laser beam passes through the slot aperture and hits the target marker. Use the aligning pin for fine adjustment.

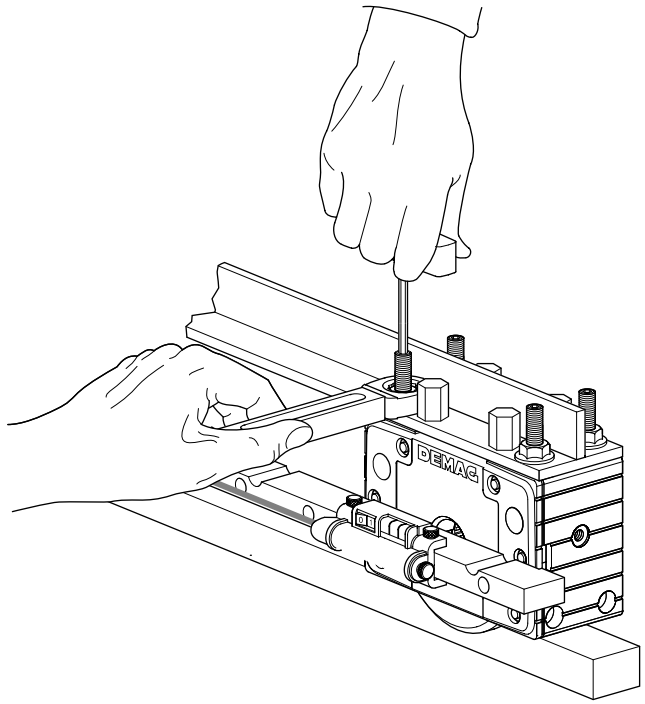

Fig. 9

41445044.eps

Secure the wheel blocks using the hexagon socket key and the torque wrench according to the assembly instructions in section 4.2.1.

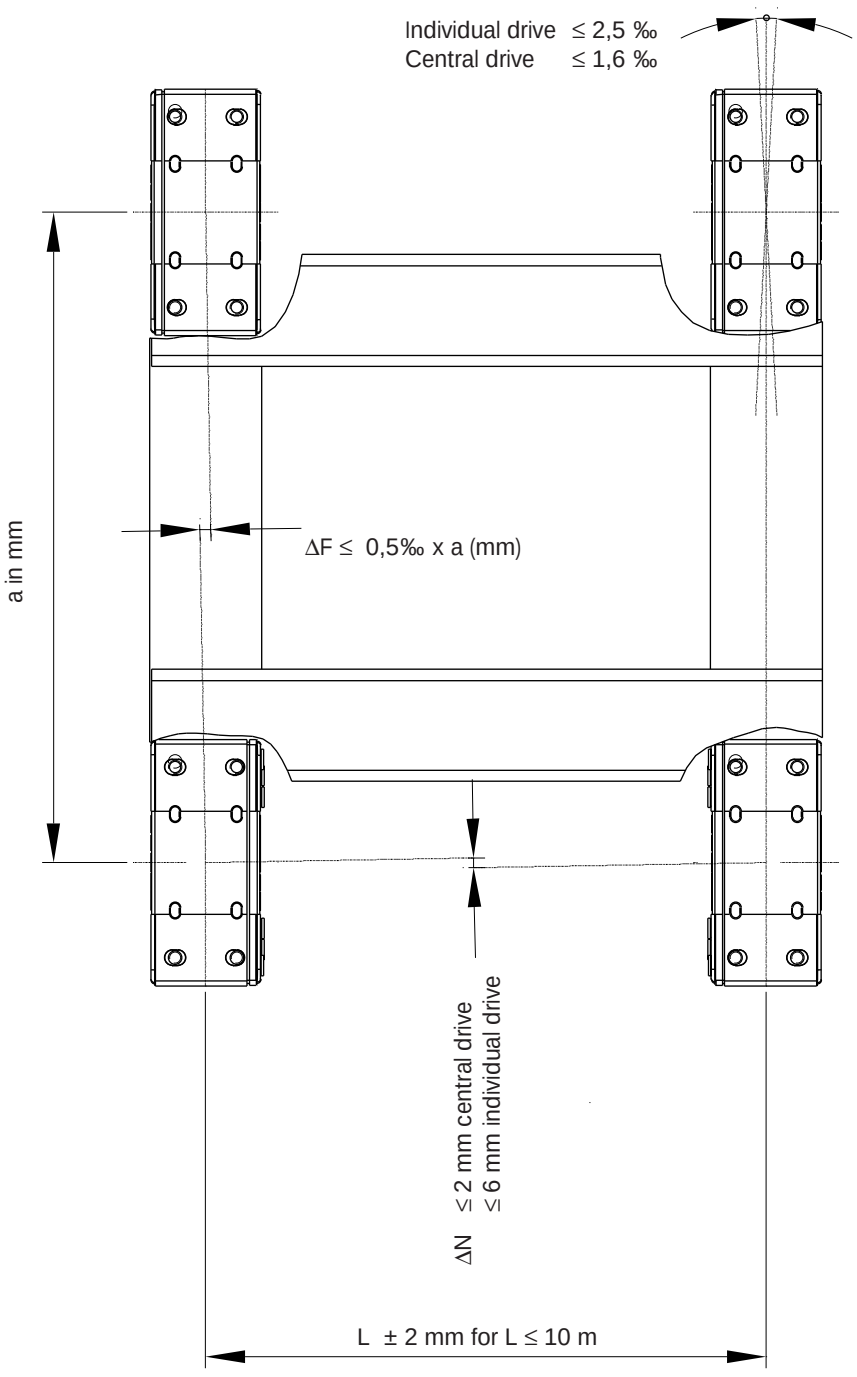

Fig. 10

41642744.eps

The values given in figure 10 are sufficient for normal applications.

Further information on tolerance is given in the relevant standards and guidelines.

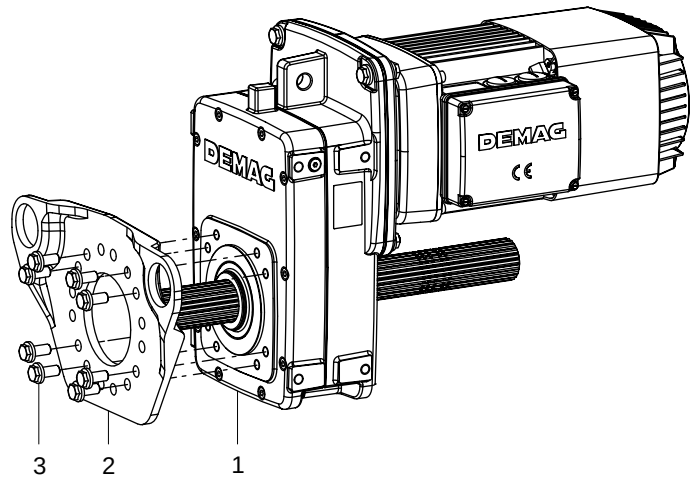
2) After having tightened the nuts, please check the bolted connections of the wheel block (see also sections 5.2.2 and 5.3.2)!

5.1.3 A 50 type offset gearboxes

Fitting for top, side and pin connection arrangements
MA200-2 torque bracket connection



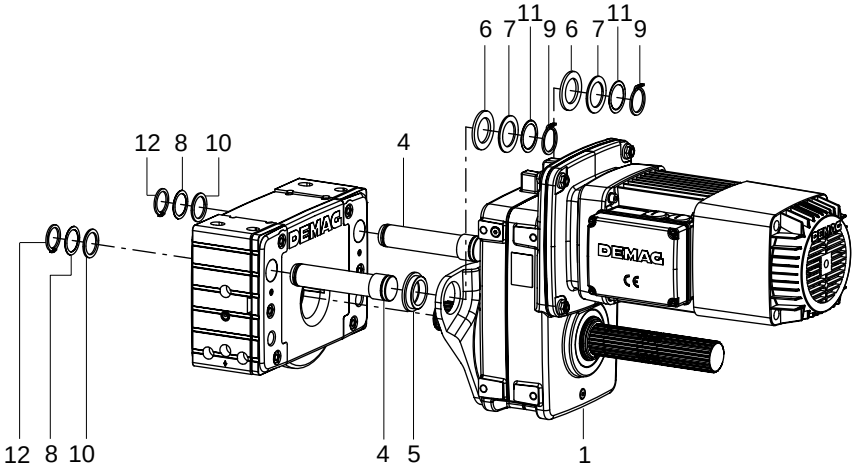
1 Offset gearboxes
2 Torque bracket
3 Locking bolt

Tightening torque
see table below

42115244.eps

Assembly

- Remove corrosion protection and paint from contact surface of gearbox and torque bracket.
- Fit torque bracket (2) to gearbox (1) using locking bolts (3) included in the supply.



1 Offset gearbox
4 Pin (adapter sleeve for side connection)
5 Polyamide collared sleeve
6 Polyamide washer
7 Thrust washer
8 Thrust washer
9 Retaining ring
10 Shim
11 Shim
12 Retaining ring

42115144.eps

Assembly

- Insert pin (4) into wheel block and secure against axial movement with thrust washers (8), shims (10) and retaining ring (12).
- Place polyamide collared sleeves (5) and drive unit (1) onto pin (4).
- Fit polyamide washer (6), thrust washer (7), shim (11) and retaining ring (9) in the sequence indicated.

Size		Torque bracket	Locking bolt (3)	
Wheel block	Gearbox		Number dimension	Tightening torque
DRS 200	AD 50	MA200-2	8x / M12x25	130 Nm

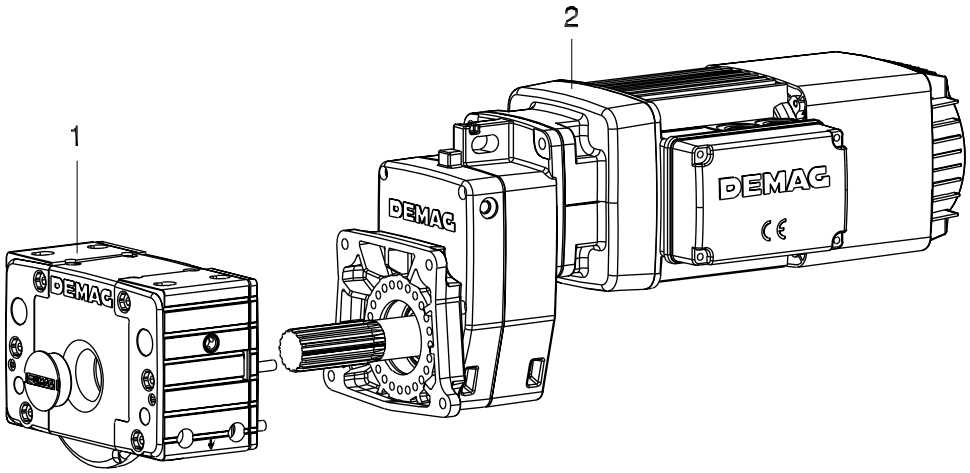
5.2 Individual drive units

5.2.1 With A type offset gearboxes ournal shaft on one side with involute splines

Clean drive shaft before fitting, check splined profile section and grease with DG 69 grease.



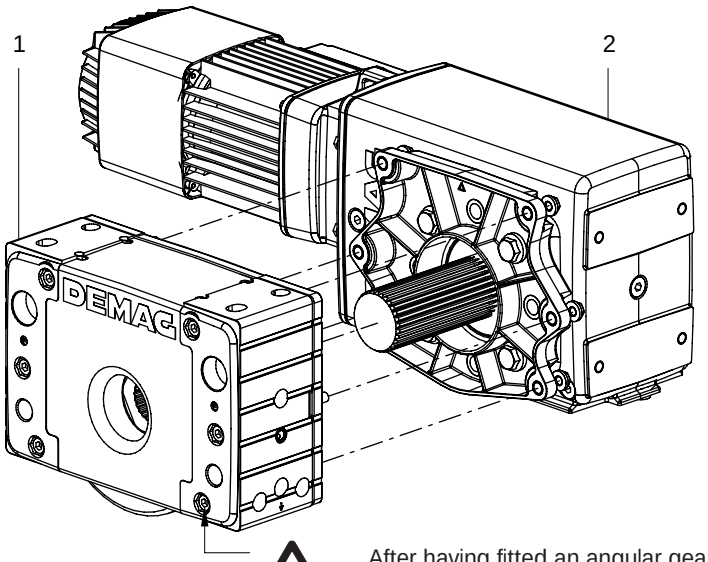
Assembly

Connect travel drive (2) with wheel block (1) as in section 5.1

41807044.eps

5.2.2 With W type angular gearboxes

Clean drive shaft before fitting, check splined profile section and grease with DG 69 grease.



After having fitted an angular gearbox type W 50, check the bolted connections of the wheel block for the correct tightening torque (72 Nm)!

Assembly

Connect travel drive (2) with wheel block (1) as in section 5.1

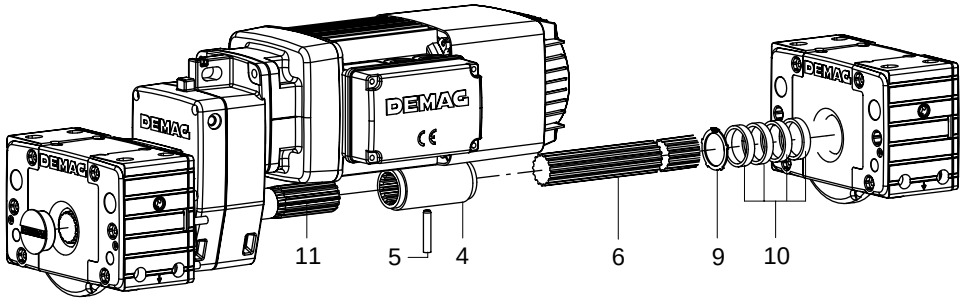
41807355.eps

5.3 Central drive units

5.3.1 With A type offset gearboxes

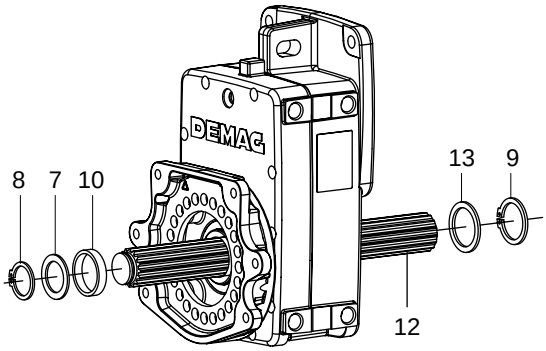
Clean drive shaft before fitting, check splined profile section and grease with DG 69 grease.

Drive arrangement **ournal shaft on both sides with involute splines**

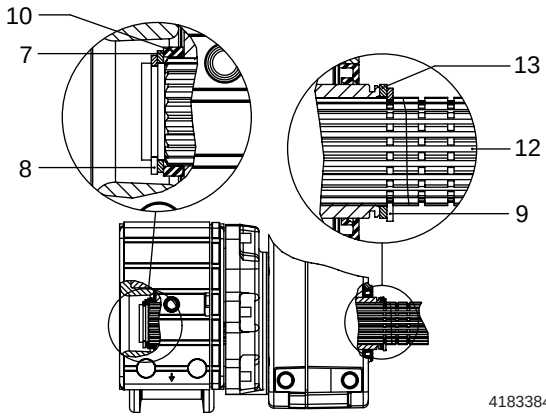


41806944.eps

Drive arrangement **ollow shaft with solid shaft**



41807144.eps



41833844.eps

Assembly

- Connect travel drive (2) with wheel block (1) as described in section 5.1.
  Journal drive shaft arrangements do not need to be secured against axial displacement. Hollow drive shaft arrangements (12) must be secured against axial displacement by fitting retaining rings (8/9) and thrust washers (7/13) as well as spacer ring (10) included in the supply.
- Insert roll pin (5) into connector (4).
- Slide connector (4) onto drive shaft (11/12).
- Insert central drive shaft (6) into wheel block (3).
- Place spacer rings (10) onto central drive shaft (6) and push the shaft into the connector until it stops against the roll pin.
- Determine the quantity of spacer rings (10) required until the retaining ring groove is reached.
- Secure central drive shaft (6) against axial displacement by fitting retaining ring (9).

5.3.2 With W type angular gearboxes

Clean drive shaft before fitting, check splined profile section and grease with DG 69 grease.

Drive arrangement ournal shaft on both sides with involute splines

Assembly of central drive unit with shaft protection

- Connect travel drive (2) with wheel block (1) as described in section 5.1. Journal drive shaft arrangements do not need to be secured against axial displacement. Hollow drive shaft arrangements (12) must be secured against axial displacement by fitting retaining rings (8/9) and thrust washers (7/13) as well as spacer ring (10) included in the supply.
- Push adapter (14) onto tube I (15) and slide this unit onto drive shaft (11/12) with thrust washer (13).
- Insert roll pin (5) into connector (4).
- Slide connector (4) onto drive shaft (11/12) and push recessed end into tube I (15).
- Pre-assemble 2 x shaft protection tube II (16) with adapter (14).
- Roll O rings (17) onto both ends of tube III (18).
- Insert central drive shaft into wheel block (3).
- Place spacer rings (10) onto central drive shaft (6) and push the shaft into the connector until it stops against the roll pin. Determine the quantity of spacer rings (10) required until the retaining ring groove is reached.
- Push through central drive shaft (6) in the direction of wheel block (3) and slide on pre-assembled shaft protection tubes II and III over the shaft with thrust washer (13) and retaining ring (9).
- Slide back central drive shaft (6) until reaching stop in adapter (4) and secure against axial displacement by fitting spacer rings (10) and retaining ring (9).
- Position the shaft protection tubes. Roll O rings (17) off tube III and place into grooves of adapters (14) to secure them against displacement.

5.4.2 With W type angular gearboxes

Clean drive shaft before fitting, check splined profile section and grease with DG 69 grease.

41641944.eps

Fitting

- Fit guide rollers to wheel block as shown above and tighten by hand.
- Tighten locking bolts (2/3) with specified tightening torque (see table).
- Adjust roller distance dimension “x” and align guide rollers to rail.
- Tighten locking bolts (1) with specified torque (see table).

Fitting for wheel block not prepared before leaving the factory

If a wheel block is fitted with a roller guide arrangement at a later date, the following additional measures must be carried out:

- Drill bore holes on cover side to diameter d4 and depth a8 and fit roll pins with slot facing **upwards** .
- Fit two threaded inserts into the end face.

Wheel block size	Tightening torque Locking bolt			Dimensions in mm			
	1	2	3	x_{min}	x_{max}	a8	d4
DRS 112	130 Nm			1	5	35	13

DPG80 DPG100 DP 100	20	12,5
DP 130	25	16
DP 160 [1)]	14	21

1) Only one type E2 shim required.

214276K3.p65/1098

7 Maintenance

7.1 Maintenance instructions

DRS wheel blocks

Owing to their design, DRS wheel blocks are maintenance free.

NA – BA – BF motors

See Operating instructions ident no. 214 228 44

AU – AD – AG – AF – AM offset geared motors

See Operating instructions ident no. 214 206 44

WU – WG – WF angular geared motors

See Operating instructions ident no. 214 058 44

Refer to the above mentioned operating instructions for information on gearbox lubrication intervals, lubricants and quantities of lubricants.

Shafts

Lubrication interval: 10000 hours of operation, at least every 4 years.
Under extreme operating conditions (e.g. multiple shift operation) shorter intervals (every quarter) must be selected.

Lubricant: DG 69 grease
Part no. 472 915 44 (0,4 kg)

Bolted connections

Bolted connections must be inspected annually.
Under extreme operating conditions (e.g. multiple shift operation) shorter intervals (every quarter) must be selected.

Comparable lubricants

DG 60 oil

e.g. Aral Degol BG 220, Esso Spartan EP220,
BP Energol GR-XP 220, Shell Omala Oil 220,
Mobilgear 630

DG 69 grease

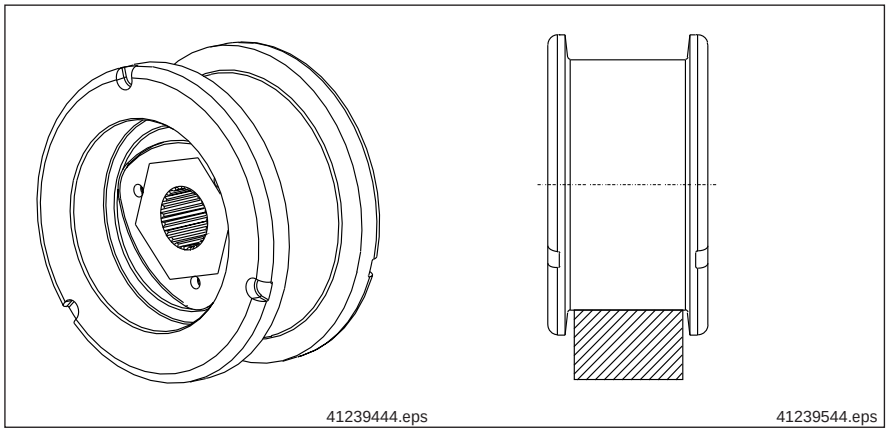
e.g. Esso-PEN-O-LED EP Grease Shell Alranina G2
BP Energrease LS 2 Aral Aralub HL 2

7.2 Travel wheel wear

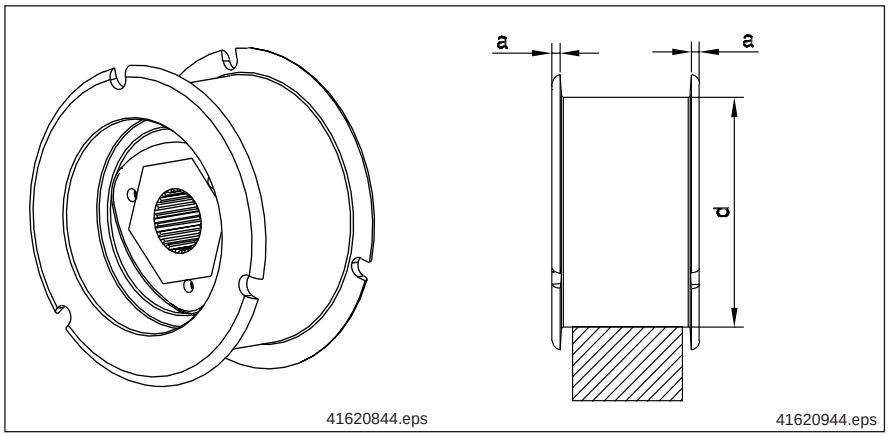
7.2.1 Flange wear

The wear indicator on the flange facilitates preventive inspections of the installation.

Travel wheel when new



Worn travel wheel



The travel wheel must already be replaced even if only **one** segment of the wear indicator is open.

7.2.2 Tread wear

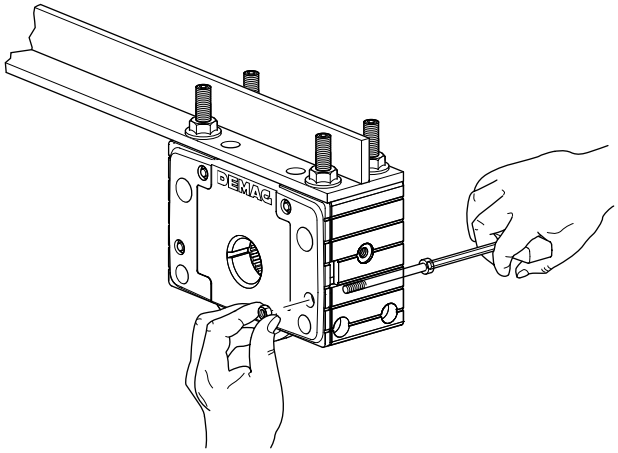
Travel wheels must be replaced when the following limit values are reached:

Nominal travel wheel diameter	Minimum remaining flange width a	Minimum travel wheel diameter d	Max. difference in travel wheel diameters for coupled wheels
		Dimensions in mm	
112	5,0	105,4	0,1
125	6,0	118,4	0,1
160	7,0	153,4	0,15
200	8,4	193,0	0,15

7.3 Possible problems

Description of problem	Possible cause	Remedy
Increased travel wheel wear (tread or flange)	Wheel block is misaligned	Re-align the wheel blocks
	Rail is dirty	Clean the rail
Running noises	Wheel block is misaligned	Re-align the wheel blocks
	Rail is dirty	Clean the rail
	Defective bearing	Replace the travel wheel

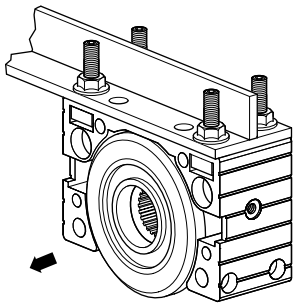
8 Removing and fitting travel wheels



Remove the cover

Undo the cover screws and lever off using the recess on the side of the wheel block.

41445544.eps

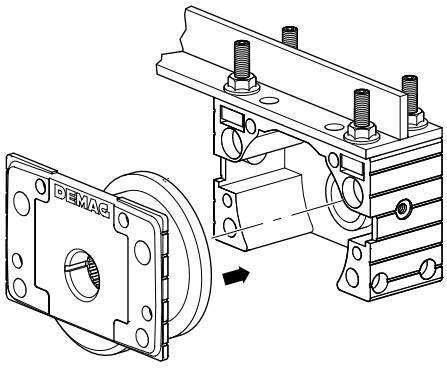


Remove the travel wheel

Remove the travel wheel with the ball bearings.

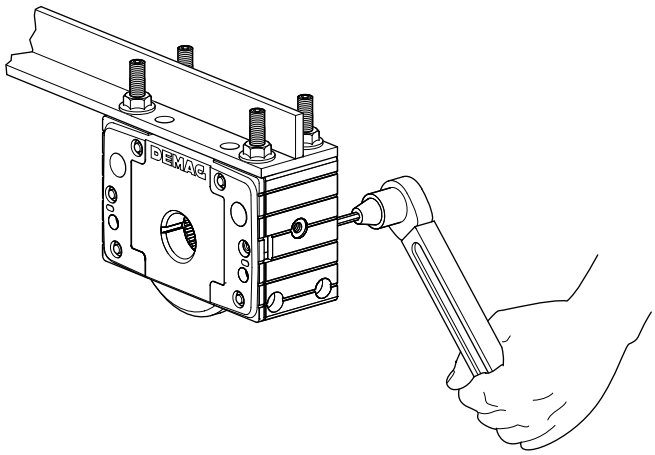
41445344.eps

Fig. 15



Fit the travel wheel and bearings in the reverse order to disassembly.

41445444.eps



Bolt the cover and housing together with the corresponding tightening torque (see table below).

Wheel block si e	Tightening torque
DRS 112	36 Nm
DRS 125	36 Nm
DRS 160	72 Nm
DRS 200	72 Nm

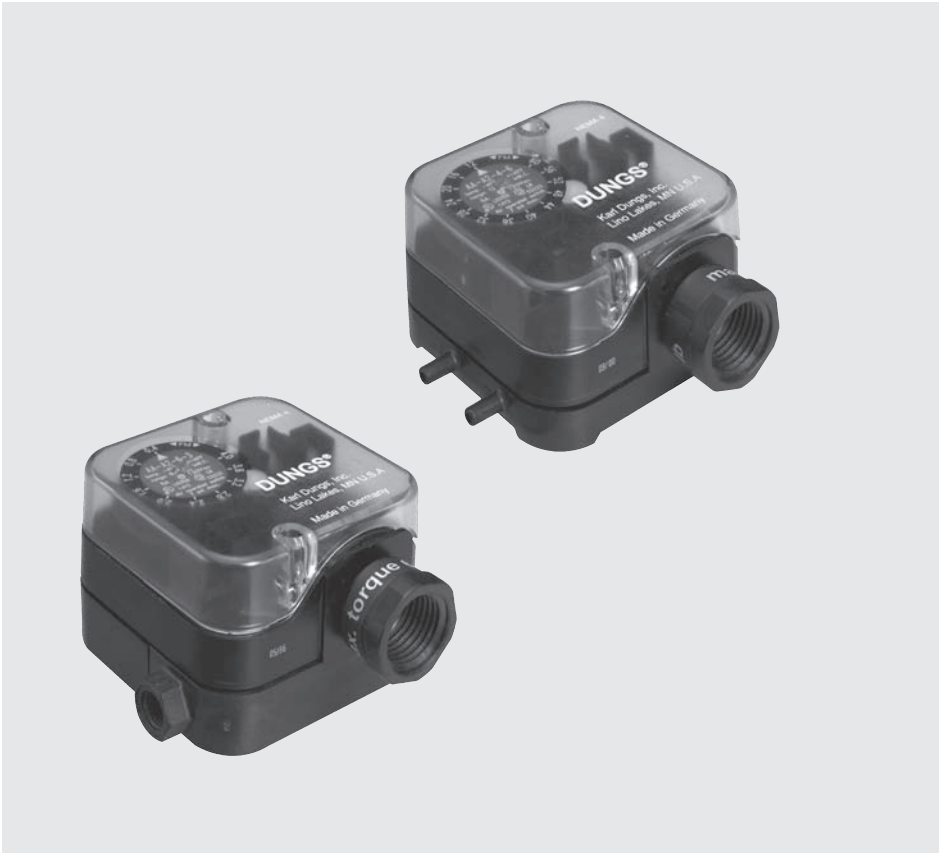
Codes and Standards
This product is recommended for installations covered by but not limited to NFPA 85, NFPA 86, ANSI Z83.4/CSA 3.7, ANSI Z83.18/CSA 4.9, ANSI Z21.13, CSD-1, UL 795, CSA B149.1, CSA B149.3 and CSA B149.6.

DUNGS is an ISO 9001 manufacturing facility.



Description

AA-A2… differential pressure switches are field adjustable, compact pressure switches for automatic burner controls. Available with hose or NPT threaded connections.

AA-A2-4… differential pressure switches are suitable for making and/or breaking a circuit when the medium pressure changes relative to the set point. AA-A2-4… versions feature hose connections.

AA-A2-6… differential pressure switches are suitable for making and/or breaking a circuit when the medium pressure changes relative to the set point. AA-A2-6… versions feature NPT threaded connections that also include a test button in the lower housing.

Application

Differential pressure monitoring in firing, ventilation and air-conditioning systems. The AA-A2… can be used as a pressure, vacuum or differential pressure switch for air and non-aggressive gases. Not suitable for natural gas, propane, butane and other combustable gases.

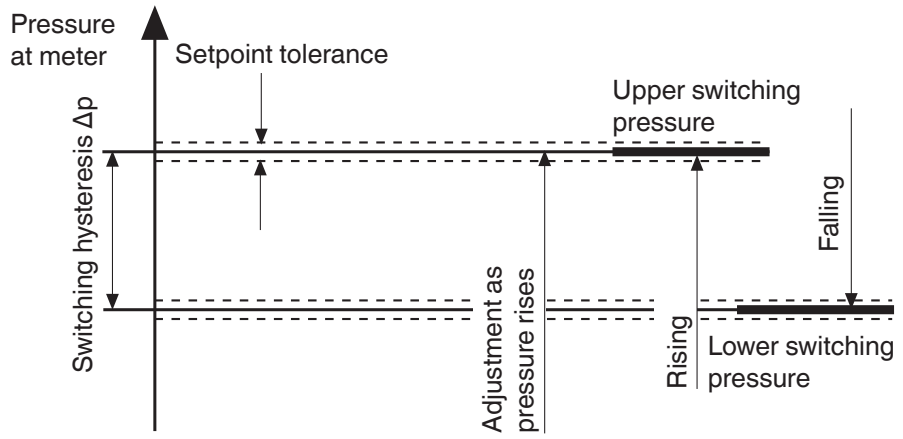
AA-A2… SPDT differential pressure switch in pressure and vacuum ranges. The differential pressure acts via the diaphragm against the force of the setting spring on the microswitch. The pressure switch operates without any auxiliary power

Specifications

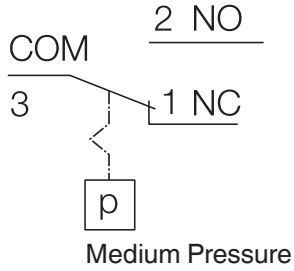
Max. operating pressure	7 PSI (500 mbar)	
Pressure connection	**AA-A2-4 Hose connection** 5/32" (4.6 mm) dia. positive 5/32" (4.6 mm) dia. negative	**AA-A2-6 Threaded connection** 1/4" NPT positive 1/8" NPT negative 5/32" (4.6 mm) test connection
Temperature range	Ambient temperature Medium temperature	-40 °F to +140 °F (-40 °C to +60 °C) -40 °F to +140 °F (-40 °C to +60 °C)
Materials	Housing: Switch: Diaphragm: Switching contact:	Polycarbonate Polycarbonate NBR-based rubber Silver (Ag)
Electrical ratings	AC eff. DC	min. 24 V max. 250 V min. 24 V max. 48 V
Current ratings	AC 5A resistive @ 120 VAC AC 3A inductive @ 120 VAC DC min. 20 mA @ 24 VDC DC max. 1A @ 12 - 48 VDC	
Electrical connection	Screw terminals via 1/2" NPT conduit connection	
Enclosure rating	NEMA Type 4	
Setting tolerance	±15% switching point deviation referred to set point, adjusted as pressure rises, vertical diaphragm position	
Installation position	Multipoised	

⚠ Installation position: Standard installation position is vertical upright diaphragm. When installed horizontally, the pressure switch switches at a pressure higher by approx. 0.2 in. W.C. When installed upside down, the pressure switch switches at a pressure lower by approx. 0.2 in. W.C. When installed in other positions, the pressure switch switches at pressure deviating from the set reference value by max. ± 0.2 in. W.C.

Definition of switching hysteresis Δp
The pressure difference between the upper and lower switching pressures.



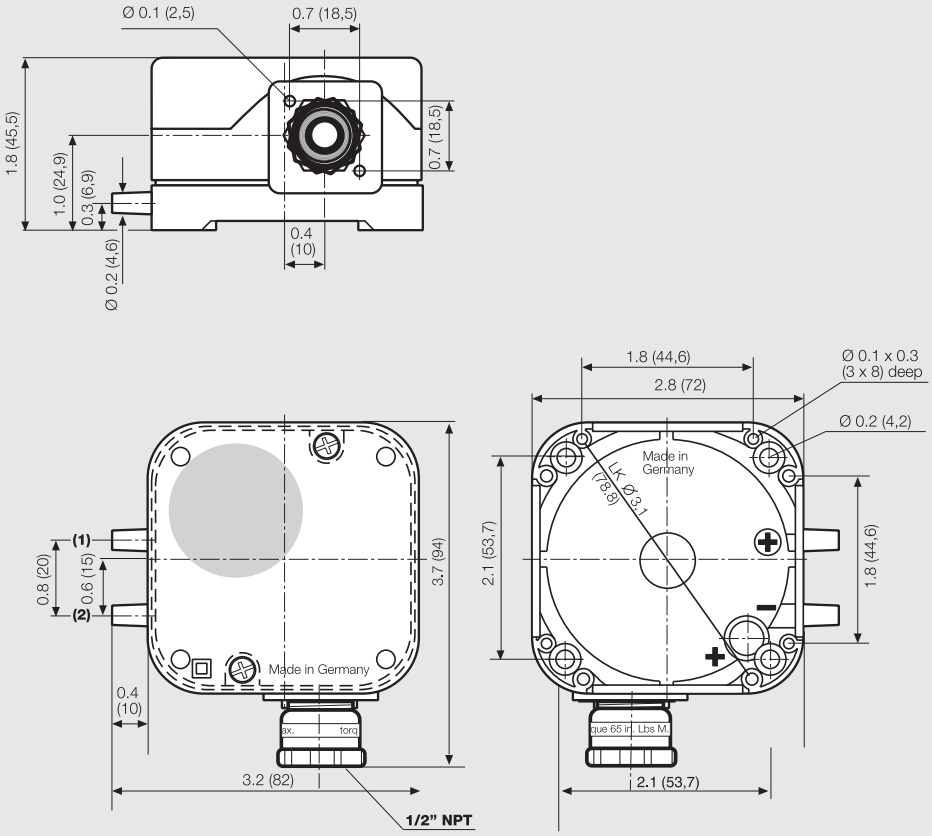
AA-A2… switching function
As pressure rises:
1 NC opens, 2 NO closes
As pressure falls:
1 NC closes, 2 NO opens



Dimensions inch (mm)

1 Pressure connection (+)
2 Pressure connection (–)
3 Test nipple p(+)

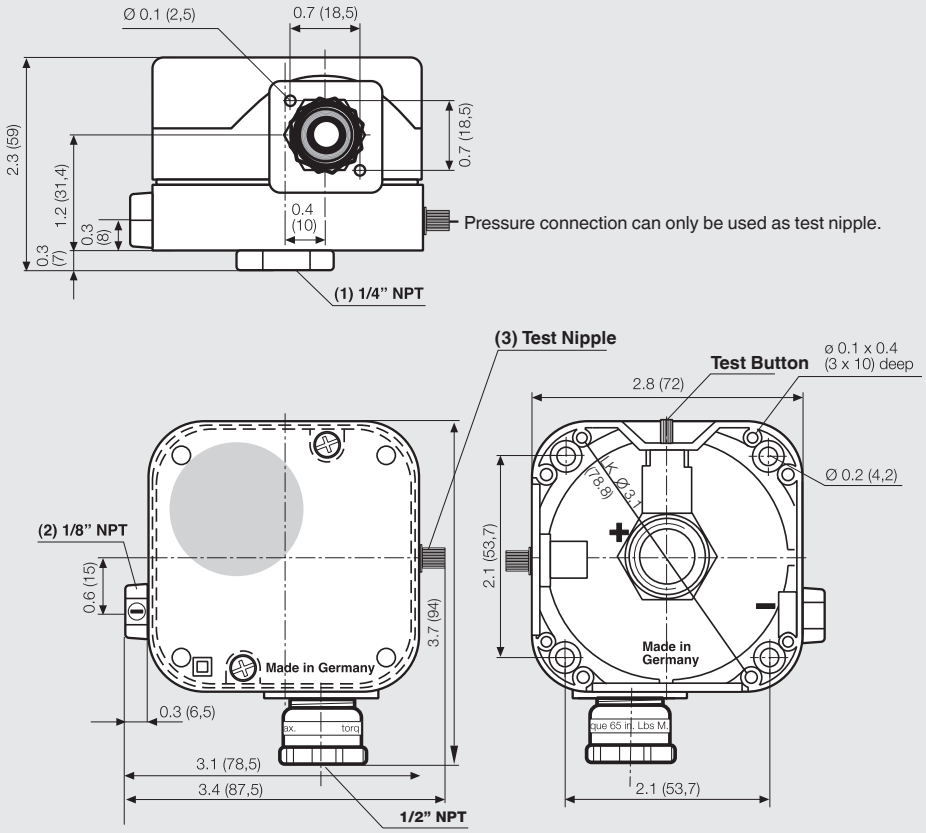
AA-A2-4… Hose connection



Dimensions inch (mm)

1 Pressure connection (+)
2 Pressure connection (–)
3 Test nipple p(+)

AA-A2-6… Threaded connection



Test button

The AA-A2-6… threaded version is equipped with a test button. When the test button is pressed, the connection to the 1/4" NPT pressure connection is interrupted and the pressure below the diaphragm is relieved. The microswitch of the pressure switch changes the contact position from NO to NC.

If the test button is released, the pressure below the diaphragm is built up again and the microswitch changes to its original position.

Differential pressure switch for air, flue and exhaust gases

Pressure switch for gas and air

GAO-A4…
GMH-A4…
GML-A4…

DUNGS®
Combustion Controls

UL Listed
- UL 353
- File # MH 16628

CSA Certified
- CSA C22.2 No. LR 53222
- Certification file # 201527

FM Approved
- Class 3510, 3530
- File # J.I. 1Y919.AF

Commonwealth of Massachusetts Approved Product
- Approval code G3-0106-191
- Gas pressure switch

Codes and Standards
This product is intended for installations covered by but not limited to NFPA 85, NFPA 86, UL 795, CSD-1, ANSI Z83.4, ANSI Z83.18, ANSI Z21.13, CSA B149.1, CSA B149.3 and CSA B149.6.

DUNGS is an ISO 9001 manufacturing facility.

Description
The GAO-, GMH- and GML-A4… ventless pressure switches are adjustable pressure switches for automatic burner controls.

These pressure switches are suitable for making and/or breaking a circuit when the medium pressure changes relative to the set point. The set point can be set in the field by an adjustable dial with an integrated scale. Test nipple integrated in metal housing to verify set point.

Application
The GAO-, GMH-, and GML-A4… pressure switch is recommended for industrial and commercial heating, ventilation and air-conditioning systems.

The GAO-, GMH-, and GML-A4… pressure switch is suitable for dry natural gas, propane, butane, air and other inert gases. Suitable for up to 0.1 % by volume, dry H_2S.

A “dry” gas has a dew point lower than +15 °F and its relative humidity is less than 60 %.

GAO-A4… SPDT pressure switch requires no auxiliary power. The GAO-A4… is suitable for making and/or breaking a circuit when the set point is exceeded or undershot. A tripped switch is indicated by a neon light after set point is exceeded or undershot. Automatic reset when pressure returns below or above set point.

GMH-A4… SPDT pressure switch requires no auxiliary power. The GMH-A4… is suitable for making and/or breaking a circuit when the set point is exceeded. A tripped switch is indicated by a neon light after set point is exceeded. Manual reset is required to reset the switch.

GML-A4… SPDT pressure switch requires no auxiliary power. The GML-A4… is suitable for making and/or breaking a circuit when the set point is undershot. A tripped switch is indicated by a neon light after set point is undershot. Manual reset is required to reset the switch.

Specifications

Max. operating pressure	GAO-A4-4-2,3,5,6	7 PSI (500mbar)
	GMH- and GML-A4-4-4,6	7 PSI (500mbar)
	GAO-, GMH- and GML-A4-4-8	14 PSI (1000 mbar)
Max. body pressure	15 PSI (1033 mbar)	
Pressure connection	Standard: 1/4" NPT female thread centered underside of housing.	
Temperature range:		
GAO-, GMH- and GML-A4-4	Ambient temperature	-40 °F to +140 °F (-40 °C to +60 °C)
	Medium temperature	-40 °F to +140 °F (-40 °C to +60 °C)
GAO-, GMH- and GML-A4-4-8	Ambient temperature	-22 °F to +140 °F (-30 °C to +60 °C)
	Medium temperature	-22 °F to +140 °F (-30 °C to +60 °C)
Materials	Housing	Aluminium
	Switch	Polycarbonate
	Diaphragm	NBR-based rubber
	Switching contact	Silver or Gold
Electrical ratings	AC eff.	min. 24 V max. 240 V
	DC	min. 24 V max. 48 V
Nominal current	Silver (Ag) contact ratings	Gold (Au) contact ratings
	AC 10 A resistive @ 120 VAC	
	AC 8 A inductive @ 120 VAC	
	DC min. 20 mA @ 24 VDC	DC max. 5 mA @ 5 VDC
	DC max. 1 A @ 24 VDC & 48 VDC	DC max. 20 mA @ 24 VDC
Indication light	0.30 W energy consumption	
Electrical connection	Screw terminals via 1/2" NPT conduit connection	
Enclosure rating	NEMA Type 4	
Setting tolerance	±15% switching point deviation referred to set point. Adjusted as pressure rises or as pressure falls, vertical diaphragm position.	
Vent Limiter	Incorporates a vent limiter as per UL 353 and limits the escape of gas less than 1.0 CFH of natural gas at 7 PSI if internal switch diaphragm ruptures

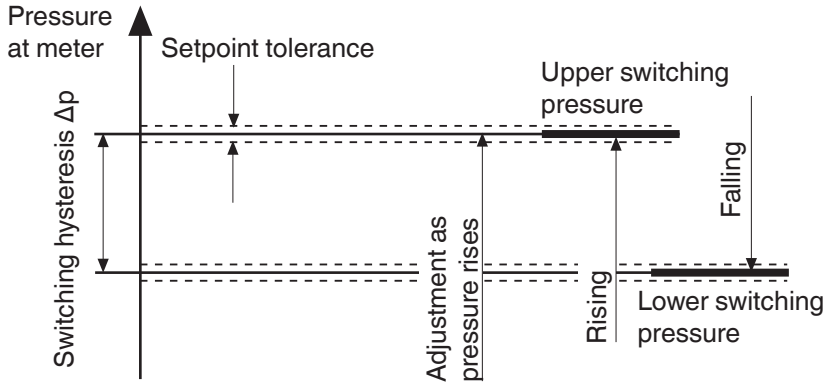
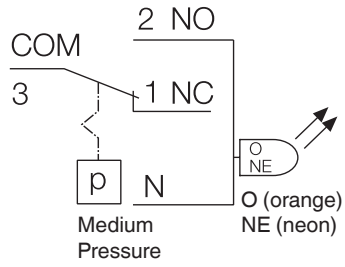
Definition of switching hysteresis Δp

The pressure difference between the upper and lower switching pressures



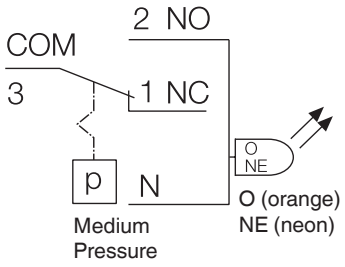
GAO (Shown as a high gas limit)

As pressure rises above set point, 1 NC opens, 2 NO closes, Neon light ON (fault). **As pressure falls** below setpoint, switch resets: 1 NC closes and 2 NO opens, Neon light off.



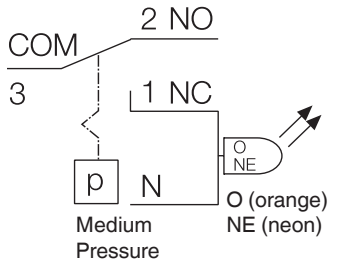
GMH (Operating state shown)

As pressure rises, 2 NO closes, 1 NC opens, and Neon light ON (fault), switch trips and locks out.

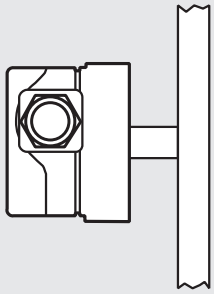


GML (**Operating state shown)**

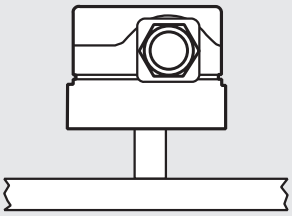
As pressure falls, 2 NO opens, 1 NC closes, Neon light ON (fault), switch trips and locks out.



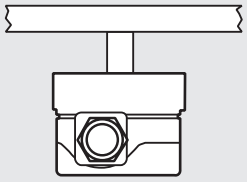
Installation position



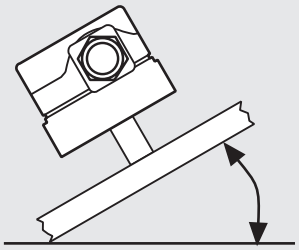
Standard installation position



When installed horizontally, the pressure switch switches at a pressure higher by approximately 0.2 in. W.C. (0.5 mbar).



When installed upside down, the pressure switch switches at a pressure lower by approximately 0.2 in. W.C. (0.5 mbar).



When installed in other position the pressure switch switches at pressure deviating from the set reference value by max. ±0.2 in. W.C. (0.5 mbar).

⚠ NOTE: Always calibrate the switch in the desired mounting position

Dual Modular Safety Shutoff Valves

DMV-D/602 Series
DMV-DLE/602 Series

DUNGS®
Combustion Controls

Two normally closed safety shutoff valves in one housing; each with the following approvals.

UL Recognized
- UL 429
- File # MH16727

CSA Certified
- ANSI Z21.21
- CSA 6.5
- Marked C/I
- File # 1010989

FM Approved
- Class 7411
- File # J.I.1Z6A0.AF

Commonwealth of Massachusetts Approved Product
- Approval code G1-1107-35
- Gas Safety Shutoff Valve

US, Canadian and EU Models
- DMV-D 701/602, 702/602, 703/602
- DMV-DLE 701/602, 702/602, 703/602
- 1/2 in. NPT - 2 in. NPT
- Rp1/2 - Rp2

Codes and Standards
This product is intended for installations covered by but not limited to NFPA 37, NPFA 86, ANSI Z83.4, ANSI Z83.18, ANSI Z21.13, CSD-1, UL 795, CSA B149.1 and CSA B149.3.

DUNGS is an ISO 9001 manufacturing facility.

Description
The Dual Modular Valve (DMV) combines two automatic shutoff valves in one compact housing, which can be wired independently or in parallel.

Valve 1 (V1) of the DMV-D and DMV-DLE series is fast opening and fast closing. Valve 2 (V2) of the DMV-D is fast opening, while V2 of the DMV-DLE is slow-opening for smoother light-off. Max. flow adjustment on V2 provides variable main flow on both models.

Internal profiles and compact design optimize flow and provide a low pressure drop. Three body styles reduce inventory.

Directly mounting the following accessories creates a compact valve train without additional piping:
- Pressure regulator
- High and low gas pressure switches
- Valve proving system
- Vent line adapter

Application
The DMV is recommended for industrial and commercial heating applications that require two safety shutoff valves. The DMV is suitable for dry natural gas, propane, butane, air and inert gases.

A “dry” gas has a dew point lower than +15 °F and its relative humidity is less than 60 %.

DMV-D…/602	Two normally closed safety shutoff valves in one housing. V1 and V2 are fast opening, fast closing. Adjustable max. flow with V2.
DMV-DLE…/602	Two normally closed safety shutoff valves in one housing. V1 fast opening, fast closing. V2 is slow opening, fast closing. Adjustable max. flow and adjustable initial lift with V2.

Specifications

Body sizes Pipe size / Thread	DMV 701 1/2" - 1" NPT or Rp	DMV 702 1" - 2" NPT or Rp	DMV 703 1" - 2" NPT or Rp
Max. operating pressure	7 PSI (500 mbar) UL, FM	5 PSI (360 mbar) CSA	
Max. body pressure	15 PSI (1000 mbar)		
Max. close off pressure	7 PSI (500 mbar) UL, FM	5 PSI (360 mbar) CSA	
Electrical ratings (+10 % / -15 %)	110 - 120 VAC @ 50 - 60 Hz 24 VAC @ 50 - 60 Hz; 24 VDC		
Power ratings	DMV 701: 45 VA Ratings shown are total power consumption for both valves inclusive. Inrush and full load current have the same VA rating.	DMV 702: 65 VA	DMV 703: 90 VA
Enclosure rating	NEMA Type 12		
Electrical connection	DIN-connector with 1/2" NPT conduit adapter		
Operating time	100 % duty cycle		
Closing time	< 1 s		
Opening time (to max. flow)	DMV-D 525/11 DMV-DLE 525/11	V1 & V2 < 1 s V1 < 1 s; V2 Adjustable to approx. 10 to 20 s at 70 °F	
Initial lift adjustment	Adjustable on V2	DLE only; 0 to 70 % of total flow; 0 to 35% of stroke	
Max. flow adjustment	Adjustable on V2	<10 to 100 % of total flow; <10 to 100% of stroke	
Materials in contact with gas	Housing: Aluminium, Steel; free of non-ferrous metals Sealings on valve seats: NBR-based rubber		
Ambient temperature rating	-40 °F to +150 °F (-40 °C to +65 °C)		
Installation position	Safety shutoff valve from vertically upright to horizontal		
Gas filter (optional)	Replaceable integral gas filter (50 micron) in inlet of DMV or Pre-Mount Filter Block for DMV 702 and 703. (Cannot be used with FRI directly mounted to the DMV)		
Gas strainer (standard)	Installed in the housing upstream V1 (23 mesh)		
Position indication (order separately)	CPI 400 with indication lamps and SPDT interlock switch or Visual indicator (VI)		
Test ports / Pressure switch mounting ports	G 1/8 ISO 228 ports available on both sides. Each side has one port upstream V1, one between V1 and V2, one downstream V2, and one on each flange.		
Valve proving system	Requires VPS 504; mounts directly to either side of DMV		

FRI Gas pressure regulator
Mounting the FRI series gas pressure regulator directly to the DMV dual safety shutoff valve is possible with a mounting kit.
The FRI pressure regulator can be installed upstream or downstream of the DMV dual safey shutoff valve depending on application requirements.

Replacement FRI to DMV mounting kit
FRI 705 - 707/6 to DMV 701/602
Order No. 219-967

FRI 710-712/6 to DMV 702/602 & 703/602
Order No. 219-968

Additional Accessories

VPS 504
Valve proving system (approved by some authorities having jurisdiction in lieu of vent valve and "proof of closure").

Integral gas filter (optional)
50 micron gas filter

Pre-Mount Filter (optional)
50 micron gas filter

GAO/GMH/GML A2
gas pressure switch

Position indication
CPI 400 with indication lamps and SPDT interlock switch, or visual indicator (VI)

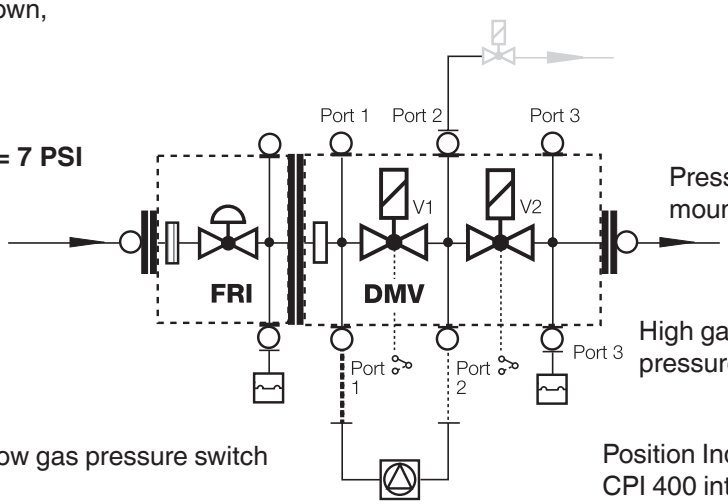
DMK butterfly control valve
Mounts directly downstream of DMV to modulate gas flow. Requires actuator. Use DMA actuator with DMK butterfly valve.

DMV D(LE) 7xx/602 VL (with vent line adapter)
Factory installed vent line adapter which integrates a vent line connection with the DMV series.

Adapters
- 1/4" NPT adapter (225-047)
- 1/2" NPT Pilot gas adapter; Check flow requirements. (225-043)
- G 1/8" Test nipple (219-008)
- Port 3 Pressure switch mounting adapter (214-975)

DMV dual safety shutoff valve modular system
Optional mounting system shown,
other configurations possible

DMV dual safety shutoff valve with upstream FRI pressure regulator



Pressure switch can be mounted on flange

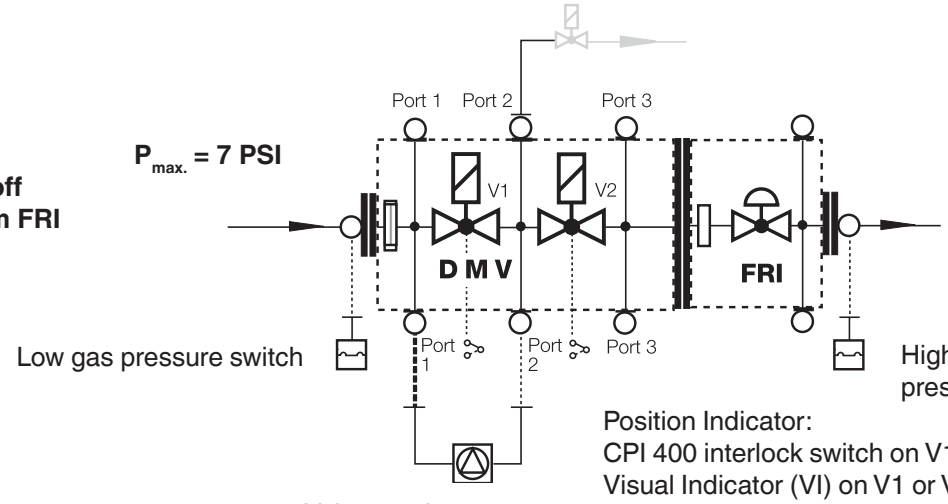
High gas pressure switch

Low gas pressure switch

Position Indicator:
CPI 400 interlock switch on V1 or V2
Visual Indicator (VI) on V1 or V2, or on both

Valve proving system (VPS 504)

DMV dual safety shutoff valve with downstream FRI pressure regulator



Low gas pressure switch

High gas pressure switch

Position Indicator:
CPI 400 interlock switch on V1 or V2
Visual Indicator (VI) on V1 or V2, or on both

Valve proving system (VPS 504)

When an accessory is added to the DMV, it may not be possible to mount other devices.

Pressure drop for other gases
To determine the pressure drop when using a gas other than natural gas, use the flow formula below and f value located in the table below to determine the "corrected" flow rate in CFH through the valve for the other gas used. For example, when using propane, divide the volume (CFH) of propane required for the application by the calculated value f (f = 0.66 for propane). Use this "corrected" flow rate and the flow curve on the next page to determine pressure drop for propane.

Determining equivalent flow through valves using another gas

$$\dot{V}_{\text{gas used}} = \dot{V}_{\text{Natural gas}} \times f$$

$$f = \sqrt{\frac{\text{Density of Natural gas}}{\text{Density of gas used}}}$$

Type of gas	Density [kg/m³]	s.g.	f
Natural gas	0.81	0.65	1.24
Butane	2.39	1.95	0.58
Propane	1.86	1.50	0.66
Air	1.24	1.00	1.00

Pressure switch for dual modular valves

GAO-A2…
GMH-A2…
GML-A2…

DUNGS®

UL Listed
- **UL 353**
- **File # MH 16628**

CSA Certified
- **CSA C22.2 No. LR 53222**
- **Certification # 201527**

FM Approved
- **Class 3510, 3530**
- **File # J.I. 1T7A8.AF**

European models tested to EN1854 per Gas Appliance Directive 90/396/EEC and per Pressure Equipment Directive 97/23/EC.

DUNGS is an ISO 9001 manufacturing facility.

Description
The GAO-, GMH-, and GML-A2… pressure switches are compact pressure switches for DUNGS modular valve train components.

A2 pressure switches are suitable for making and/or breaking a circuit when the medium pressure changes relative to the set point. The set point can be set in the field by an adjustable dial with an integrated scale.

Application
The DUNGS GAO-, GMH-, and GML-A2… pressure switches are recommended for industrial and commercial heating applications with DUNGS DMV dual modular valves and DUNGS FRI modular pressure regulators. Various mounting options allow direct mounting on the housing.

The GAO-, GMH-, and GML-A2… pressure switches are suitable for natural gas, propane, butane, air and other inert gases.

Printed in Germany • Rösler Druck • Edition 10.02 • Nr. 226 359

GAO-A2… SPDT pressure switch requires no auxiliary power. The GAO-A2… is suitable for making and/or breaking a circuit when the set point is exceeded or undershot. A tripped switch is indicated by a neon light after set point is exceeded or undershot. **Automatic reset** when pressure returns below or above set point.

GMH-A2… SPDT pressure switch requires no auxiliary power. The GMH-A2… is suitable for making and/or breaking a circuit when the set point is exceeded. A tripped switch is indicated by a neon light after set point is exceeded. **Manual reset** is required to reset the switch.

GML-A2… SPDT pressure switch requires no auxiliary power. The GML-A2… is suitable for making and/or breaking a circuit when the set point is undershot. A tripped switch is indicated by a neon light after set point is undershot. **Manual reset** is required to reset the switch.

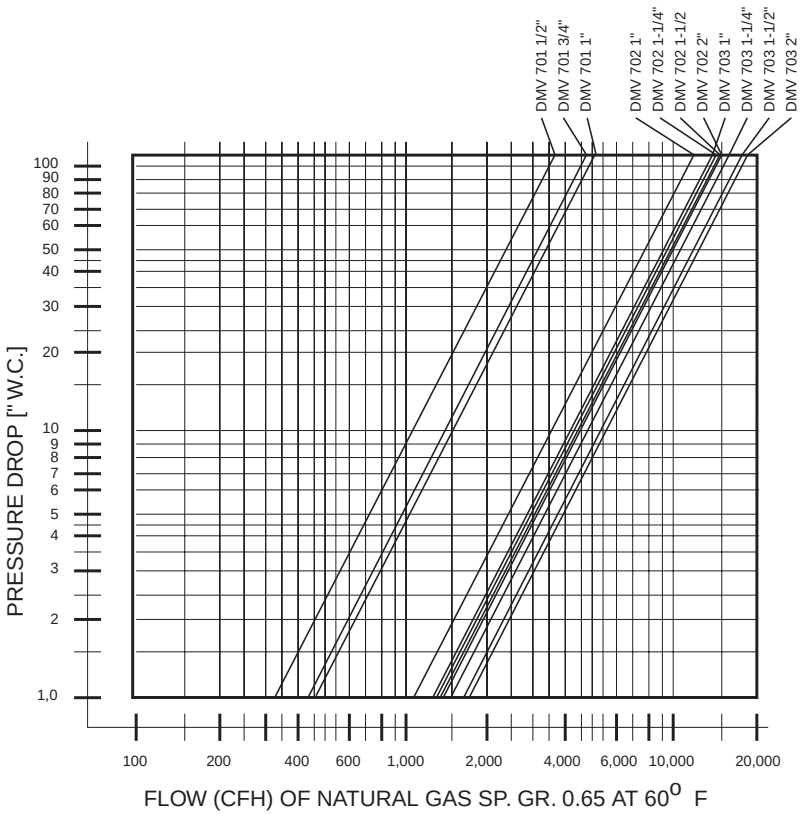
Edition 8/13/97 DMV 700 Installation Guide



INSTALLATION

- **Read these instructions carefully.**
- **Failure to follow them and/or improper installation may cause explosion, property damage and injuries.**
- **Installation must be done with the supervision of a licensed burner technician.**
- **The system must meet all applicable national and local code requirements.**
- **Check the ratings given in the specifications and on the DMV to make sure that it is suitable for your application.**
- **Never perform work if gas pressure or power is applied, or in the presence of an open flame.**
- **Protect surfaces. Make sure that seals and O-rings are clean and in good condition.**
- **Once installed, perform a complete checkout including a gas leak test.**
- **Label all wires prior to disconnection when servicing the DMV. Wiring errors can cause improper and dangerous operation.**
- **Verify proper operation after servicing.**

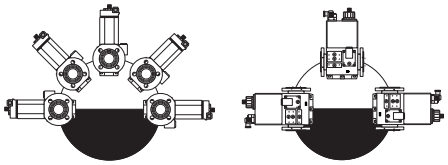
• The main gas supply must be shut off before starting the installation.
• Read these installation instructions carefully.
• Examine the DMV for shipping damage.
• The inside of the DMV, the flanges, and piping must be clean and free of dirt.
• Remove all dirt and debris before installing the DMV. Failure to remove dirt/debris could result in valve damage or improper performance.

Recommended Procedure to Mount the Flanges

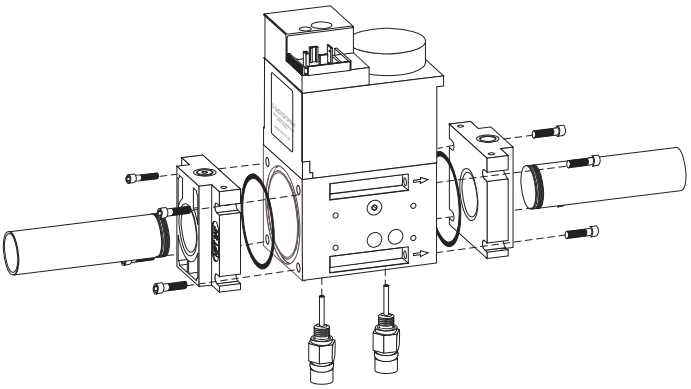
• Use new, properly reamed and threaded pipe free of chips.
• Apply good quality pipe sealant, putting a moderate amount on the male threads only. If pipe sealant lodges on the valve seat, it will prevent proper operation. If using LP gas, use pipe sealant rated for use with LP gas.
• Do not thread pipe too far. Valve distortion and/or malfunction may result from excess pipe in the DMV body.
• Apply counter pressure when screwing the pipe into the flanges.
• Apply a parallel jaw wrench only to the flats on the flange.
• Do not overtighten the pipe. Follow the maximum torque values listed below.

1/2"	3/4"	1"	1-1/4"	1-1/2"	2"	NPT pipe
375	560	750	875	940	1190	[lb-in]

• Unpack the DMV 701 (702/703) and remove the 8 M6 (M8) socket cap head screws using a 5 mm (6 mm) Allen wrench.
• Remove the two white protective plastic covers from the DMV body.
• Make sure the O-rings and the grooves are clean and in good condition.
• Install the DMV with the gas flow matching the direction indicated by the arrows on the casting.
• **CAUTION:** If the flow is not in the same direction of the arrows, the valves may not operate properly.
• Mount the DMV only with the solenoid vertical upright to horizontal.



• Clean the mounting surface of the flanges. Make sure they are in good condition.
• Attach the DMV to the flanges using the M6 (M8) socket cap screws supplied.



• Use a 5 mm (6 mm) Allen wrench for the DMV 701 (DMV 702/703) mounting screws.
• Tighten the screws in crisscross pattern.
• Do not overtighten the screws. Follow the maximum torque values listed below.

M6	M8	screw size
62	134	[lb-in] maximum torque

• After installation is completed perform a leak test to verify that no leakage occurs.

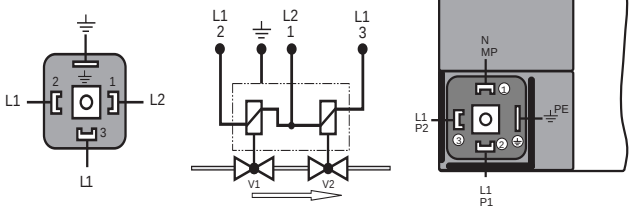
POSITION INDICATION

Valve position indication is required by various authorities having jurisdiction.
Two indicators, one of which might be the CPI 400, are shipped with, but not attached to, the DMV series valve to insure that the indicators are not damaged during shipment. Therefore install the indicators onto the DMV after mounting the DMV into the gas train and before the DMV is put into service.
• **CAUTION**: The valves must be de-energized and their gas supply shut off before installing the Position Indicators.

• **Installation**
• Remove the two plugs and O-rings in the bottom of the valve with a 3/16” (5mm) hex key wrench. These are the taps were the Indicators go.
• Insert the Visual Indicator and its attached O-ring using a 5/8" (16 mm) open end wrench.
• Turn clockwise until the Visual Indicator is sufficiently tightened.
• DO NOT overtighten or you will destroy the rubber O-ring.
• Apply the adhesive-backed stickers supplied which show what the colors of the indicator signify to the DMV. The stickers should be applied on each side of the valve body so the operator can refer to either of them while viewing the Visual Indicator.
• After installation is completed perform a leak test to verify that no leakage occurs.
• For installation of a CPI 400 follow the instructions supplied with the CPI 400.

WIRING

• Disconnect all power to the valves before beginning the wiring to prevent electrical shock and equipment damage.
• Do not exceed the electrical ratings given in the specifications and on the DMV.
• Attach a flexible 1/2” NPT conduit to the DIN connector.
• Route the wires through the conduit and the DIN connector.
• Use 14 or 16 gauge wire suitable for at least 75 °C (167 °F).
• Connect the wiring to the appropriate screw terminals in the DIN connector.
• Plug the DIN connector onto the AMP terminals. Fasten the DIN connector with the screw supplied.
• **CAUTION:** All wiring must comply with local electrical codes, ordinances, and regulations. An ultimate electrical enclosure must be provided.

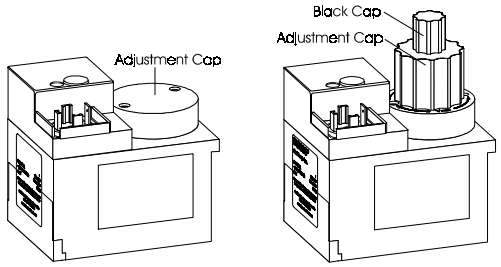


OPERATION

Main Flow Setting

The valves are supplied with the main flow adjustment fully open. To adjust the gas flow proceed as follows:

- **CAUTION:** Make sure the flow of gas does not create a hazard.
- Locate the flow adjustment cap on top of the DMV. There are two screws in the cap. The holding screw is recessed and has a blue sealing compound on it, while the pan head screw protrudes from the cap.
- **CAUTION**: Do not adjust or remove any screws or bolts which are sealed with a red or blue colored compound. Doing so will void all approvals and warranties.
- Loosen the pan head screw until you can manually rotate the flow adjustment cap for 1-1/2 to 2 turns.
- Turn the cap clockwise for less gas or counterclockwise for more gas.
- Check the flow at the burner with an orifice or flow meter until you have achieved the desired flow.
- Tighten the pan head screw on the adjustment cap.



Initial Fast Lift Adjustment (DMV-DLE .../6 only)

The initial fast lift adjustment varies the initial gas flow through the valve as the valve seat begins to open. This adjustment can vary the initial flow between 0 % and 70% of the total gas flow. All DMV-DLE valves are shipped from the factory with no initial fast lift. To adjust the lift proceed as follows:

- Unscrew the small black cap on top of the flow adjustment cap to expose the initial lift adjustment knob.
- The black cap also serves as tool; turn the cap over and insert it into the corresponding slot on the adjustment knob.
- Turn the knob clockwise for a shorter initial lift or counter-clockwise for a longer initial lift.
- Once the desired initial fast lift has been achieved, reinstall the black cap.

Test Port

The G 1/8 ISO 228 taps are available on both sides upstream V1, between V1 and V2, downstream V2, and on both flanges. The G 1/8 test nipple (Ordering Number: D 219 008) can be screwed in any of these pressure tap ports.

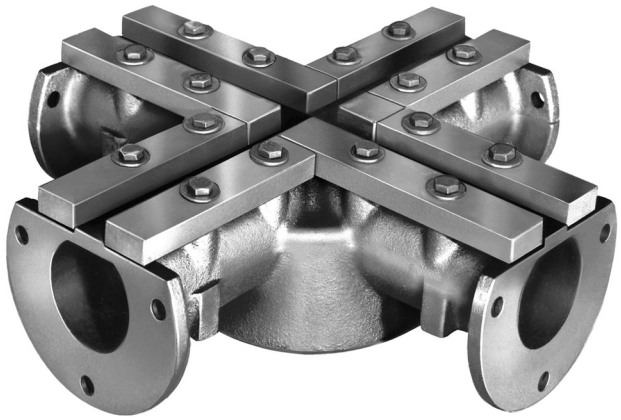
Eclipse Line Burners



Eclipse Line Burners are premix, retention type burners designed for applications where heat must be distributed over a large area. They are especially suited for oven, kettle, and either recirculating or non-recirculating air heating applications. Several types of line burner sections are available, making a variety of flame patterns possible. Capacities range from 19,000 to 335,000 BTU/hr per lineal foot (based on 70% of required air in premix) depending upon the mixture pressure used.

Assemblies

Eclipse Line Burners are available in 6" and 12" straight sections; side and bottom inlet straight sections; bottom inlet crosses and tees; and 6" 90-degree elbows. Each line burner section is supplied with the nuts and bolts necessary for assembly. In some cases, factory assembly is available. When selecting Line Burners for a system, the total port area must not exceed the cross sectional area of the mixture inlets. Based on a 70% premix using natural gas, the total capacity of the ports should not exceed 385,000 BTU/hr for each 2" mixture inlet or 850,000 BTU/hr for each 3" mixture inlet. Accessory flanges to aid in piping and brackets for mounting flame monitoring and piloting equipment to the burners are also available.

Design Features

Eclipse Line Burner bodies are made of cast iron for durability and flanged for easy assembly. The drilled ports and steel retention lips provide flame stability with mixture pressures up to 30" w.c. and velocities past the burner up to 3600 fpm (burner firing parallel to the air stream). Maximum ambient temperatures should not exceed 800°F.

Line Burners can fire with rich, neutral or lean mixtures. Suitable air/gas mixtures can be supplied by a variety of Eclipse mixing equipment including: High Pressure Injectors, Bulletin 650; Low Pressure Proportional Mixers, Bulletin 652; Vari-Set® Mixers, Bulletin 654.

Advantages

- Excellent flame retention
- Wide range of capacities
- Adaptable to many piping arrangements
- Heavy duty construction

Ignition and Flame Monitoring

Reliable ignition from a single point can be provided by using the optional pilot / flame sensor bracket to mount a blast or atmospheric pilot at one end of the burner. A second pilot / flame sensor bracket can be used to mount a flame monitoring device at the opposite end of the burner.

⚠ CAUTION

- **It is dangerous to use any fuel burning equipment unless it is equipped with suitable flame sensing device(s) and automatic fuel shut-off valve(s). Eclipse can supply such equipment or information on alternate sources.**

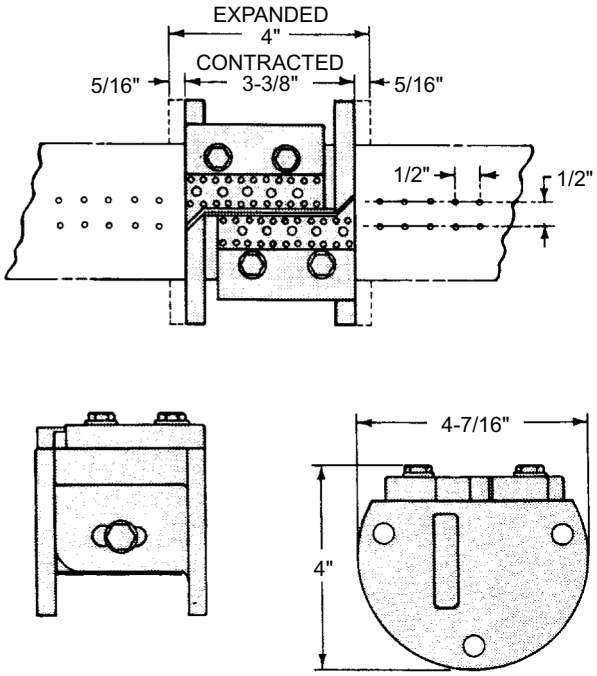
Accessories for Line Burners

Expansion Joint — Assembly Number 181014

Eclipse Line Burner Expansion Joints are used in the center of a row of line burners to eliminate the possibility of bowing or buckling due to burner expansion. They are also used to relieve stress on mixture piping when a row of burners is fed by two mixture lines from a common manifold. When an expansion joint is used, it is necessary to have gas / air mixture fed to burners on both sides of the joint as the mixture will not pass through it.

Maximum velocity past the expansion joint should be limited to 3600 fpm and ambient temperature limited to 800°F.

Expansion joints are furnished with number 3 L drillings. Using 70% premix, capacity is 57,000 BTU/hr at 4" w.c. mixture pressure, using natural gas of 0.6 specific gravity.



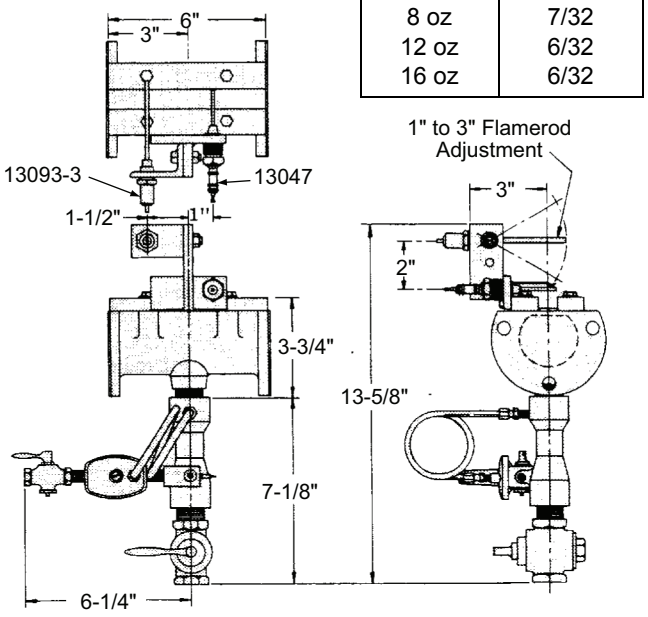
Pilot Section — Assembly Number 180192, Catalog Number 2L6SP

Eclipse Line Burner Pilot Sections are composed of a 6" Eclipse Line Burner, a 131 Pilot Mixer, and a combination ignition electrode and flamerod mounting bracket. The assembly also includes a 6" flamerod and a self-grounding ignition electrode. By simply loosening a nut on the flamerod bracket, the flamerod may be adjusted to obtain the best flame signal output.

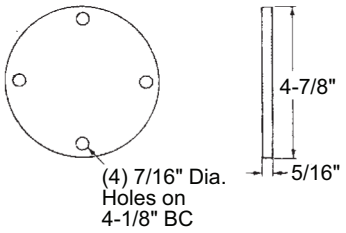
Two divider plates are supplied with each pilot section. It is important that these plates are assembled between the pilot section and adjoining burners as the pilot has its own source of gas / air mixture. If the pilot section is to be used at either end of a row of burners, it must be ordered with a plain end flange, assembly number 180006. See "Accessories" section.

The Line Burner Pilot Section is rated at 25,000 BTU/hr at 2" w.c. mixture pressure and with 70% of required air through the mixer. When ordering, be sure to specify jet size required or air pressure available to the pilot mixer, as indicated in the following table:

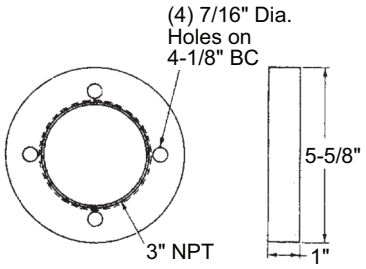
Air Press.	Jet Size
4 oz	9/32
8 oz	7/32
12 oz	6/32
16 oz	6/32



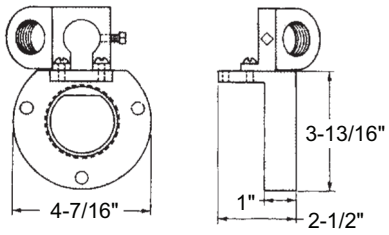
Flanges and Adapters



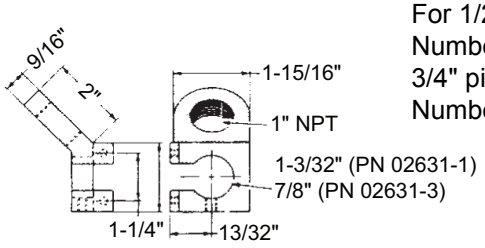
Plain Bottom Flange. For closing off bottom inlet on 12 x 12" CROSS or 12 x 6" TEE. Assembly Number 180007.



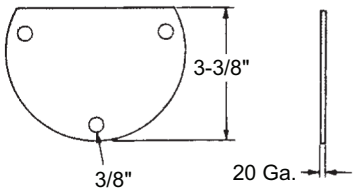
3" Bottom Inlet Flange. Add to 12 x 12" CROSS or 12 x 6" TEE when flanged inlet is desired. Part Number 00514.



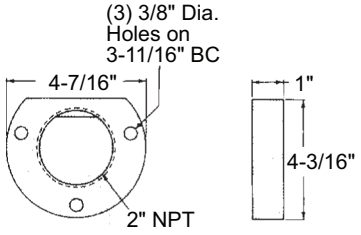
Inlet Flange with Pilot / Flame Sensor Mounting Bracket. For 1-1/2" NPT and 3/4" pilot. Assembly Number 180017.



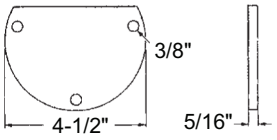
Pilot/Flame Sensor Mounting Bracket. For 1/2" pilot. Part Number 2631-3. For 3/4" pilot. Part Number 2631-1.



Divider Plate. For separating zones. Part Number 10591.



Inlet End Flange. For 1-1/2" NPT. Assembly Number 180008. For 2" NPT. Assembly Number 180009.



Plain End Flange. For closing off end of burner section. Assembly Number 180006.

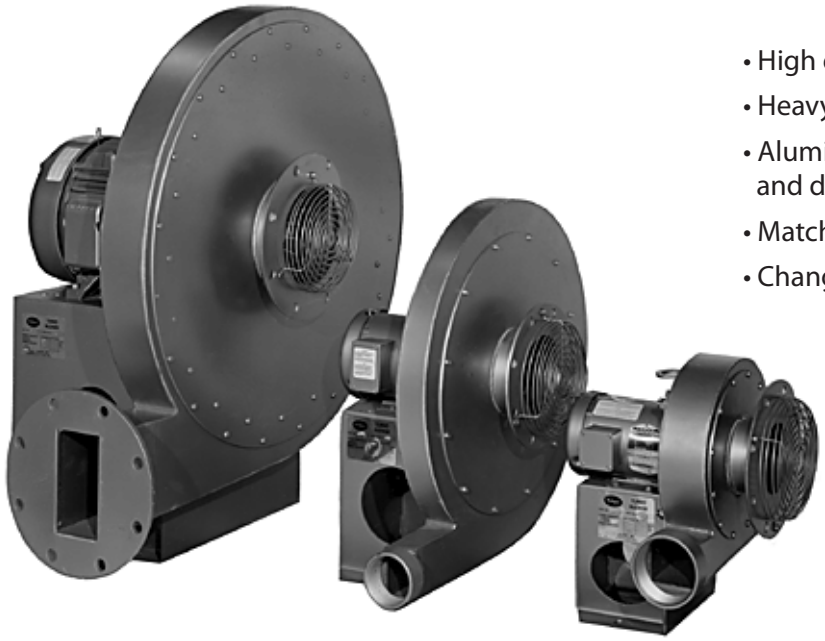
ECLIPSE TURBO BLOWERS
SERIES "SMJ"



- High efficiency
- Heavy gauge steel base and housing
- Aluminum impellers balanced statically and dynamically
- Matching air filters available
- Changeable outlet positions

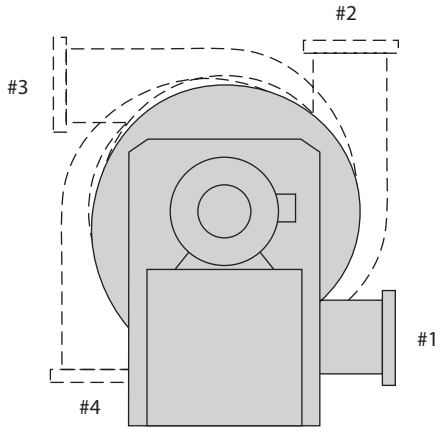
Eclipse "SMJ" Blowers are centrifugal blowers that provide low pressure air for industrial combustion systems. They are also used for cooling, conveying, drying, liquid agitation, smoke abatement, vacuum cleaning, fume and dust exhaust-ing, and other appli-cations where air temperatures are under 220ûF (104ûC).

All "SMJ" Blowers are constructed of continuous welded, heavy gauge steel. The impellers are made of lightweight, high strength, riveted aluminum. Outlets on 3" and 4" models are threaded, while all others are flanged for a standard 125# ANSI companion flange. Discharge ports are sized to keep pressure losses within reasonable limits.

Blower inlet flanges are equipped with a grill that complies with OSHA regulations. If desired, the grill may be removed and the inlet bolted to a standard ANSI companion flange. Eclipse-supplied motors are standard shaft and starting torque, ball bearing, 3600 rpm units. On any blower requiring 3/4 HP or more, Eclipse recommends that polyphase motors be used.

There are four possible outlet positions. Any exist-ing position is easily changed by removing the hous-ing from the blower base and remounting it in the desired position. Positions 1 through 3 can be speci-fied for any blower. Position 4, however, requires fac-tory approval before ordering. Position 1 is the stan-dard assembly (bottom, horizontal) unless otherwise specified.

"SMJ" Blowers can be supplied with counterclock-wise (CCW) or clockwise (CW) rotation as viewed from the motor side. CCW rotation is furnished stan-dard unless otherwise specified.



Outlet Positions

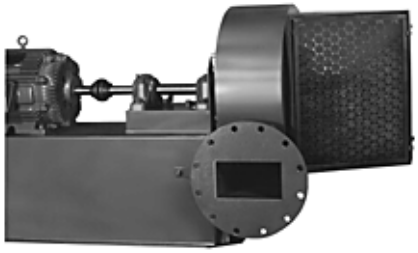
Model Variations



Type "D"
A.M.C.A. Arrangement #8

Type "D" construction features a separate impeller shaft connected to the motor shaft by a flexible coupling. It is often used where immediate interchangibility of motors is required (photo shows inlet filter installed).

Type "P"
A.M.C.A. Arrangement #1

Type "P" construction permits the blower to be driven by a gasoline engine, line shaft or other separate power source.

Type "V"
A.M.C.A. Arrangement #9

Type "V" construction is normally used when 60 cycle AC current is not available and motor speeds result in less than standard rpm. The V-belt drives the impeller at standard rpm regardless of motor speed.

Air Inlet Filters

Filters must be ordered separately.

Pressure Switches

Model AA-A2-6
Bulletin I-354

Eclipse-Dungs
Air Pressure Switch

Model A2 is available in a wide selection of setpoint pressure ranges for a maximum pressure of 7 PSI (498 mbar). This pressure switch is CSA certified, FM approved and UL listed. Its calibrated blue knob provides easy and accurate adjustment. A 1/4" N.P.T. high pressure air inlet connection is located on the switch bottom.

Round Filters

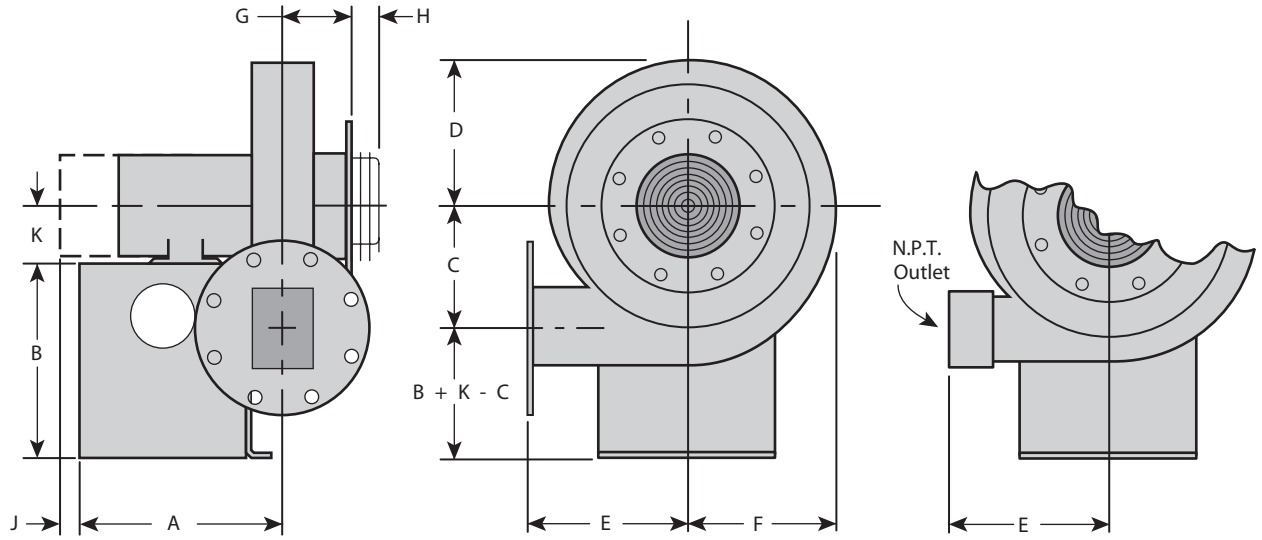
[1]D=open motor; E=enclosed motor. Horsepowers with no letter suffix are either open or enclosed.

[2]Refer to the base chart on page 4 for base mounting dimensions.

[3]Signifies an N.P.T. threaded outlet. All other blowers have flanged outlets with standard ANSI 125# bolt patterns. All inlets are flanged. Companion flanges are not standard, but are available at a nominal cost.

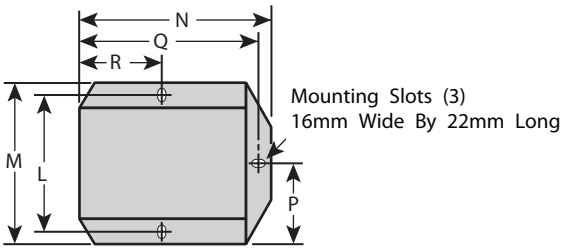
To Order: Specify blower catalog number, CW or CCW rotation, motor HP, open or TEFC, voltage and frame size.

Dimensions & Specifications –Metric Units



Flanged Outlet

Threaded Outlet



Base*	Dimensions (mm)						Bolt Dia.
	L	M	N	P	Q	R	
1	197	248	254	124	229	98	14
2	235	286	279	143	254	111	14

[1]D=open motor; E=enclosed motor. Horsepowers with no letter suffix are either open or enclosed.

[2]Refer to the base chart on page 4 for base mounting dimensions.

[3] Signifies an N.P.T. threaded outlet. All other blowers have flanged outlets with standard ANSI 125# bolt patterns. All inlets are flanged. Companion flanges are not standard, but are available at a nominal cost.

To Order: Specify blower catalog number, CW or CCW rotation, motor HP, open or TEFC, voltage and frame size.

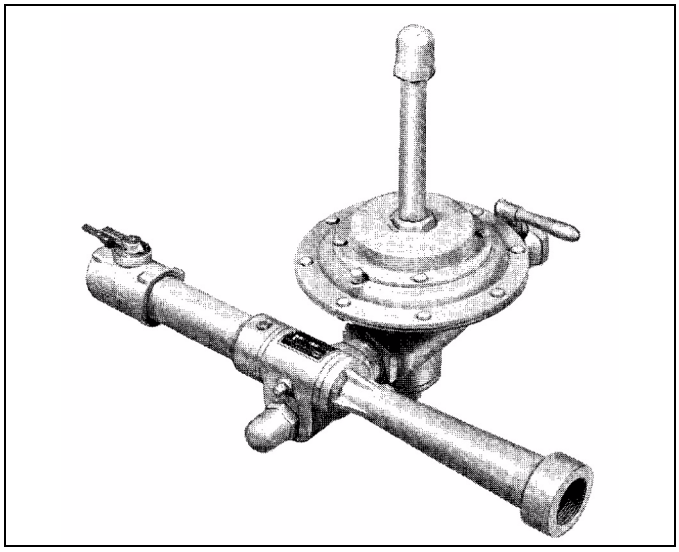
Eclipse Low Pressure Proportional Mixers

LP Series

Version 1



Eclipse Series “LP” Low Pressure Proportional Mixers are used to mix low pressure air (2 oz. to 4 psi) and any commercially available fuel gas at low pressure (4" w.c. to 16 oz.) and deliver the mixture under pressure to open or sealed premix type gas burners.

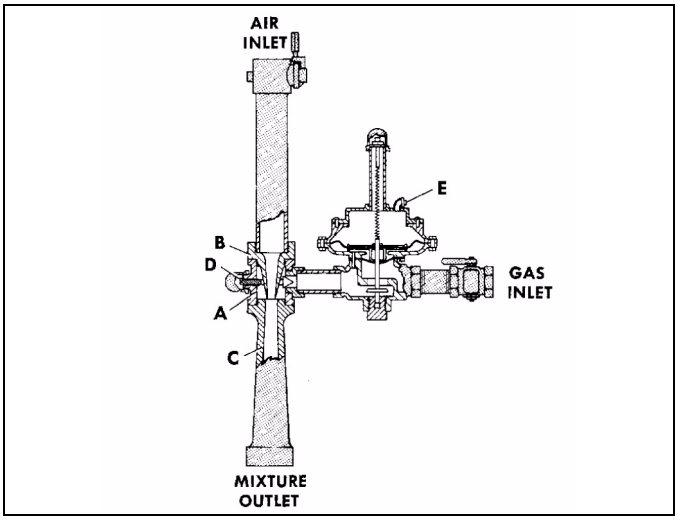
The gas is automatically entrained and mixed with the air in the correct gas:air ratio over the entire range of operation. The amount of air pressure that should be provided from the combustion air blower (Bulletin 610) will depend on the turndown range required, and this will vary according to the application.

Single valve control, as provided by the “LP” Mixer, eliminates the need for the operator to regulate both the gas and air valves as the heat requirements change. Efficiency losses invariably result when manual adjustment of both air and gas valves is dependent on gas:air ratio control. A slight excess air or excess gas condition can cause serious losses in efficiency of operation and extend length of heat-up time. When these losses are eliminated by the Series “LP” Mixer, the investment in equipment is soon repaid in fuel savings.

By providing single valve control, the proportional mixer makes temperature control adaptation very simple. It is necessary to control the air flow only, using a single control valve, and the gas flow automatically changes in direct proportion.

Operation

The complete mixer, series “LPBG”, consists of a manual butterfly valve, a venturi tube and air jet combined to create a suction, an accurate cone-type valve for gas:air ratio adjustment, a zero gas governor, and a lever handle gas shut-off cock. The gas cock is provided to shut off the gas supply when the system is not in operation, as the zero governor is not a tight shut-off valve.



Referring to the sketch, as the air flows through the jet “B” into the venturi tube “C”, a suction is created in the suction tee “A”. This suction will vary with the velocity of the air flow through the jet. The gas is entrained and mixed inside the venturi sleeve. Its flow into the tee is set by the ratio adjuster valve “D” and will vary directly in proportion to the air flow. If the gas varies in calorific value or specific gravity, a simple change in the setting of the cone adjuster “D” will again provide the correct mixture.

ECLIPSE®
Innovative Thermal Solutions

To secure highly accurate gas:air ratio control, the gas pressure must be reduced either to atmospheric or to the same pressure or suction condition as exists in the combustion chamber. If the burners being used are firing in the open or into a furnace at zero pressure, the governor is used with the breathing vent “E” open to the atmosphere. If a suction or pressure condition exists, a pipe or tubing should be run from “E” to the combustion chamber. The governor will then deliver gas only when air flows through the mixer.

If only very low air pressure is available (4 oz. or under), the suction in the entrainment tee may be sufficient to draw enough gas through the governor to maintain proper gas:air ratio. In this case, an impulse line with bleed fitting should be installed between the air manifold, downstream of control valve, and the top diaphragm chamber of zero governor. As a result, any change in air flow is transmitted to the zero governor, and gas:air ratio is maintained throughout the range of operation. Mixers are available from the factory complete with impulse line and bleed fitting installed.

The “LP” mixer can be turned to discharge the mixture in any direction for flexibility of piping, as long as the zero gas governor is in the horizontal position with spring stem upright so that the balancing spring hangs vertically. Several mixers may be manifolded to one zero governor if located reasonably close together. Each size of “LP” mixer is available in four different assemblies for ease in selecting the mixer and accessory combinations to fit your particular needs.

Selection

Selection Tables 652-1 through 652-5 give mixer selection information for various commercially available fuel gases.

Locate required gas capacity (CFH) in left-hand vertical column of appropriate selection table, locate air pressure available at mixer in upper horizontal column, and select mixer. Approximate mixture pressure is shown in the bottom horizontal column.

Tables are based on all air for combustion taken through the mixer (100% aeration). When less than 100% aeration is used, as in the case of open burners, correct the capacity for the amount of aeration and use corrected capacity for selecting mixer. (Correction factor for 80% aeration = 0.80; 70% aeration = 0.70; etc.) For smaller capacity mixers, see Bulletin 812, Pilot Mixers.

Eclipse Butterfly Valves

Full Port & Reduced Port

Version 2

Manual Control BV

Automatic Control BV

(Shown with Optional Crank Arm)

Product Description

Eclipse Butterfly Valves are designed to control air and gas flow to all types of combustion systems. They **should not** be used as tight shut-off valves.

Types Available

Valves are available for either manual or automatic control in pipe sizes 1/2" to 8". Full port, reduced port and high pressure drop constructions are available depending on pipe size and connection.

Thread Connections

The 1/2" through 4" valves are available with either NPT or Rc threads. The 6" and 8" valves are wafer type butterfly valves designed to be sandwiched between flanges on connecting pipes.

Disks

NPT Versions: Furnished with beveled or non-beveled disks, according to the selection table.

Rc Versions: Furnished with non-beveled disks.

Indication

All Eclipse butterfly valves feature an easy to read indicator plate and a slot on the end of the shaft to provide visual indication of the disk position.

Control

Manual butterfly valves 4" and smaller have an adjusting cover for setting disk position. A locking screw secures the cover at the desired setting.

Automatic control butterfly valves can be fitted with an optional crank arm or coupling. This allows integration with a variety of position control devices.

Manual wafer butterfly valves are adjusted by rotating a control arm which can be locked to the indicating plate after positioning.

Accessories

Eclipse stocks a selection of electric operators and mounting kits which can be ordered separately. The extended shaft length on the automatic butterfly valves allows the addition of either a second control arm for simultaneous automatic operation in dual valve applications, or a cam for a high/low fire microswitch arrangement.

Main Specifications

Parameter	Specifications	
Maximum Operating Pressure	1/2" - 4" (15 - 100 mm)	5 psig (350 mbarg)
	6" - 8" (150 - 200 mm)	3 psig (210 mbarg)
Operating Temperature Range	NPT Version	-40 to 140°F (-40 to 60°C)
	Rc Version	32 to 140°F (0 to 60°C)
Materials of Construction	Body	Powder Coated Cast Iron
	Shaft	Zinc Plated Steel
	Disk	Carbon Steel
	Shaft Packing Seal	Nitrile Rubber (Buna-N)
Approvals	(UL) (only 1/2" thru 4" models)	
Typical Application	Control of air or gas flow in a combustion system	
Notes on European Applications	4" thread not acceptable for gas use. 3" thread is acceptable if pressure is limited to 100 mbar (1.5 psig)

* See note below.

***NOTE:** Beveled disks physically stop against the body in the closed position. ALL 1/2" Butterfly Valves (NPT/Rc, Manual/Automatic, Beveled/Non-beveled) DO NOT have a mechanical stop limiting the travel to 75° rotation. The effective travel for flow control is 75° but the shaft will rotate 360°. The terms beveled and non-beveled do not apply to any of the 1/2" Butterfly Valves covered in this datasheet.

NOTE: Wafer Butterfly Valves are not threaded. For dimensional information, see page 7.

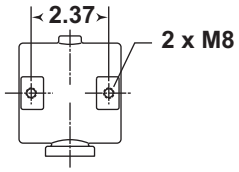
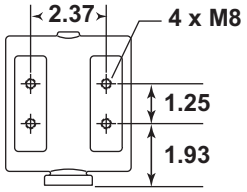
Actuator Bracket Mounting Holes

1/2" thru 2-1/2"



3" & 4"



<u>*NOTE:</u> Beveled disks physically stop against the body in the closed position. ALL 1/2" Butterfly Valves (NPT/Rc, Manual/Automatic Beveled/Non-beveled) DO NOT have a mechanical stop limiting the travel to 75° rotation. The effective travel for flow control is 75° but the shaft will rotate 360°. The terms beveled and non-beveled do not apply to any of the 1/2" Butterfly Valves covered in this datasheet.

NOTES:

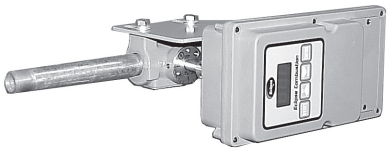
- Control Motor Mounting Kits contain brackets, couplings and miscellaneous screws and washers.
- The kits used with EMP/EMA and Honeywell valves also contain a control rod and crank arm.
- These mounting kits are designed to work in a majority of installations. Some applications may require special components.
- Items in the kit not listed are not available for individual sale.
- Contact the factory or your Eclipse representative for more detailed information.

Brackets for Eclipse T500 Actuator

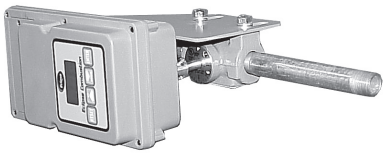
Bracket Item Code - see table above
Butterfly Valve with T500 actuator and bracket/coupling

T500 actuator can be mounted parallel or perpendicular to piping.

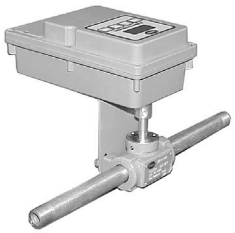
Accessories for Automatic BV's (continued)
Brackets for Eclipse PRA Rotary Actuator



Bracket Item Code 21695
Right hand mounting bracket for Eclipse Rotary Actuator



Bracket Item Code 21696
Left hand mounting bracket for Eclipse Rotary Actuator



Bracket Item Code 21934
for 1/2" to 1-1/2" valves
Bracket Item Code 21935
for 2" to 4" valves
Perpendicular mounting bracket for Eclipse Rotary Actuator

Swivel Connectors for 5/16" Diameter Control Rods

Item Code 500558 is a rotating swivel block connector assembly for joining control rod to control arm. It allows 360° rotation.

Item Code 500569 serves to connect two control rods to one control arm and also allows 360° rotation.

Item Code 14316 swivel connector allows 360° rotation. It provides a 20° flex from the swivel center line to accommodate an angular approach of a linkage control rod, but immediacy of response is less positive than Item Code 14264 (at right).

Item Code 14264 is a non-flexing swivel connector that allows 360° rotation around swivel center line. It provides a more positive positioning and immediacy of response than Item Code 14316 (at left).

Swivel Connectors for 1/2" Diameter Control Rods

Item Code 500542 is a swivel block that rotates 360°.

Item Code 500543 is a single ball swivel that rotates 360° while permitting an angular approach of rod toward control arm.

Item Code 500544 is a double ball swivel that connects two rods to one control arm. Allows angular approach of rod to arm, rotates 360°.

Introduction 1

Product Description

The ThermJet is a nozzle-mix burner that is designed to fire an intense stream of hot gases through a combustor using ambient combustion air.

The high velocity of the gases improves temperature uniformity product quality and system efficiency.

The ThermJet Burner comes in two types:

- High Velocity (HV)
- Medium Velocity (MV)

The gas velocity can be as high as 500 ft/sec for the High Velocity burner and 250 ft/sec for the Medium Velocity burner.

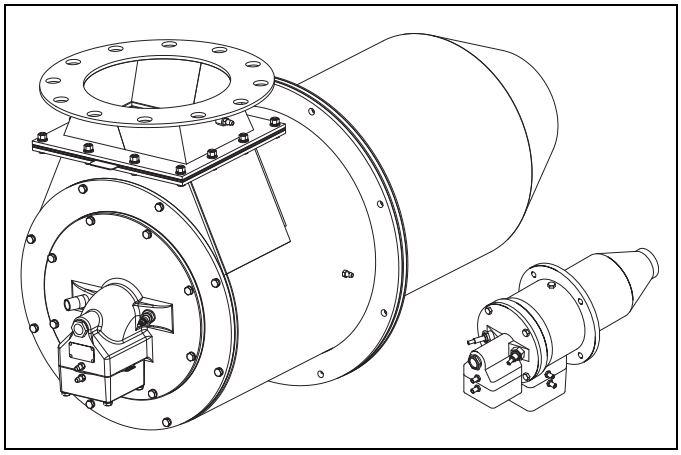

Figure 1.1. Eclipse ThermJet Burner

Audience

This manual has been written for people who are already familiar with all aspects of a nozzle-mix burner and its add-on components, also referred to as “the burner system”.

These aspects are:

- Design/Selection
- Use
- Maintenance

The audience is expected to have previous experience with this type of equipment.

Purpose

The purpose of this manual is to make sure that you carry out the installation of a safe, effective, and trouble-free system.

ThermJet Documents

Design Guide No. 205

Safety

2

Important notices for safe burner operation can be found in this section. To avoid personal injury, damage to property or the facility, the following warnings must be observed. Read this entire manual before attempting to start the system. If any part of the information in this manual is not understood, contact Eclipse before continuing.

Safety Warnings

⚠ DANGER

- **The burners covered in this manual are designed to mix fuel with air and burn the resulting mixture. All fuel handling devices are capable of producing fires and explosions if improperly applied, installed, adjusted, controlled, or maintained.**
- **Do not bypass any safety feature; fire or explosion could result.**
- **Never try to light a burner if it shows signs of damage or malfunction.**

⚠ WARNING

- **The burner might have HOT surfaces. Always wear protective clothing when approaching the burner.**
- **Eclipse products are designed to minimize the use of materials that contain crystalline silica. Examples of these chemicals are: respirable crystalline silica from bricks, cement or other masonry products and respirable refractory ceramic fibers from insulating blankets, boards, or gaskets. Despite these efforts, dust created by sanding, sawing, grinding, cutting, and other construction activities could release crystalline silica. Crystalline silica is known to cause cancer, and health risks from the exposure to these chemicals vary depending on the frequency and length of exposure to these chemicals. To reduce this risk, limit exposure to these chemicals, work in a well-ventilated area and wear approved personal protective safety equipment for these chemicals.**

NOTICE

- **This manual provides information in the use of these burners for their specific design purpose. Do not deviate from any instructions or application limits described herein without written advice from Eclipse.**

Capabilities

Adjustment, maintenance and troubleshooting of the mechanical and the electrical parts of this system should be done by qualified personnel with good mechanical aptitude and experience with combustion equipment.

Operator Training

The best safety precaution is an alert and trained operator. Train new operators thoroughly and have them demonstrate an adequate understanding of the equipment and its operation. A regular retraining schedule should be administered to ensure operators maintain a high degree of proficiency.

Replacement Parts

Order replacement parts from Eclipse only. All Eclipse approved, customer supplied valves, or switches should carry UL, FM, CSA, CGA, and/or CE approval, where applicable.

System Design 3

Design

Designing a burner system is a straight-forward exercise of combining modules that add up to a reliable and safe system.

The design process is divided into the following steps:

1. Burner model selection:
   a. The burner size and quantity
   b. The flame velocity
   c. The fuel type and pressure
   d. The combustor type
2. Control methodology
3. Ignition system
4. Flame monitoring system
5. Combustion air system: blower & air pressure switch
6. Main gas shut-off valve train selection
7. Process temperature control system

Step 1: Burner Model Selection

Burner Size & Quantity

Select the size and number of burners based on the heat balance. For heat balance calculations, refer to the Combustion Engineering Guide (EFE 825).

Use the ThermJet Price List 205 and Datasheet series 205 for performance data, dimensions, and specifications.

Flame Velocity

Each burner size comes in two versions, High or Medium Velocity. Select the version needed based on requirements for temperature uniformity, circulation, chamber size, air pressure and overall operating costs.

Flame velocity information is available in Datasheets 205-1 through 205-13.

Fuel Type & Fuel Pressure

The usable fuel types are:

- Natural gas
- Propane
- Butane

For other fuels less than 800 Btu/ft (330 MJ/m^3) contact Eclipse with an accurate breakdown of the fuel contents.

The gas pressure must be at the minimum level shown.

The required gas pressure at the burner can be found in ThermJet Datasheets 205-1 through 205-13.

Combustor

The combustor that you choose depends on the temperature and the construction of the furnace.

The furnace temperature limits of the combustors can be found in ThermJet Datasheets 205-1 through 205-13.

⚠ CAUTION

- **For tangential firing furnaces, do not use alloy combustors.**

Step 2: Control Methodology

The control methodology is the basis for the rest of the design process. Once it is known what the system will look like, the components that are in it can be selected. The control methodology chosen depends on the type of process to be controlled.

NOTE: The stated operational characteristics only apply if the described control circuits are followed. Use of different control methods will result in unknown operational performance characteristics. Use the control circuits contained within this section or contact Eclipse for written, approved alternatives.

There are two main methods to control the input of a ThermJet system. Each of these methods also has two variants. These methods may be applied to single burner as well as multiple burner systems.

The methods and variants are:

1. Modulating control:
   a. Modulating gas & air, on-ratio control or excess air @ low fire on page 7.
   b. Modulating gas with fixed-air control on page 8.
2. High/low control:
   a. High/low air & gas control (pulse firing) on page 8.
   b. High/low gas with fixed-air control (Can also be used for pulse firing) on page 9.

NOTE: Use of a ratio regulator in a fixed-air system is optional. However, eliminating the ratio regulator will

adversely affect the ignition reliability at inputs greater than 40% of maximum.

Use of a ratio regulator in a fixed-air system also provides automatic gas modulation if system air flow changes over time (such as a clogged air filter).

In the pages that follow you will find schematics of these control methods. The symbols in the schematics are explained in the “Key to System Schematics” (see Appendix).

Automatic Gas Shut-Off by Burner or Shut-Off by Zone

The automatic gas shut-off valve can be installed in two operational modes:

1. Automatic Gas Shut-Off by Burner:

   If the flame monitoring system detects a failure, the gas shut-off valves close the gas supply to the burner that caused the failure.

2. Automatic Gas Shut-Off by Zone:

   If the flame monitoring system detects a failure, the gas shut-off valves close the gas supply to all the burners in the zone that caused the failure.

NOTE: All ThermJet control schematics on the following pages reflect a single gas automatic shut-off valve. This may be changed to conform to local safety and/or insurance requirements. (Refer to the ThermJet Installation Guide No. 205.)

Modulating Gas & Air On-ratio Control or Excess Air @ Low Fire (Figure 3.1)

A burner system with modulating control gives an input that is in proportion with the demands of the process. ANY input between high and low fire is possible.

1. Air:

   The control valve ❶ is in the air line. It can modulate air flow to any position between low and high fire air.

2. Gas:

   The ratio regulator ❷ allows the on-ratio amount of gas to go to the burner. Low fire gas is limited by the ratio regulator ❷. High fire gas is limited by the manual butterfly valve ❸.

NOTE: The ratio regulator can be biased to give excess air at low fire.

NOTE: Do not use an adjustable limiting orifice (ALO) as the high fire gas limiting valve ❸. ALO’s require too much pressure drop for use in a proportional system.

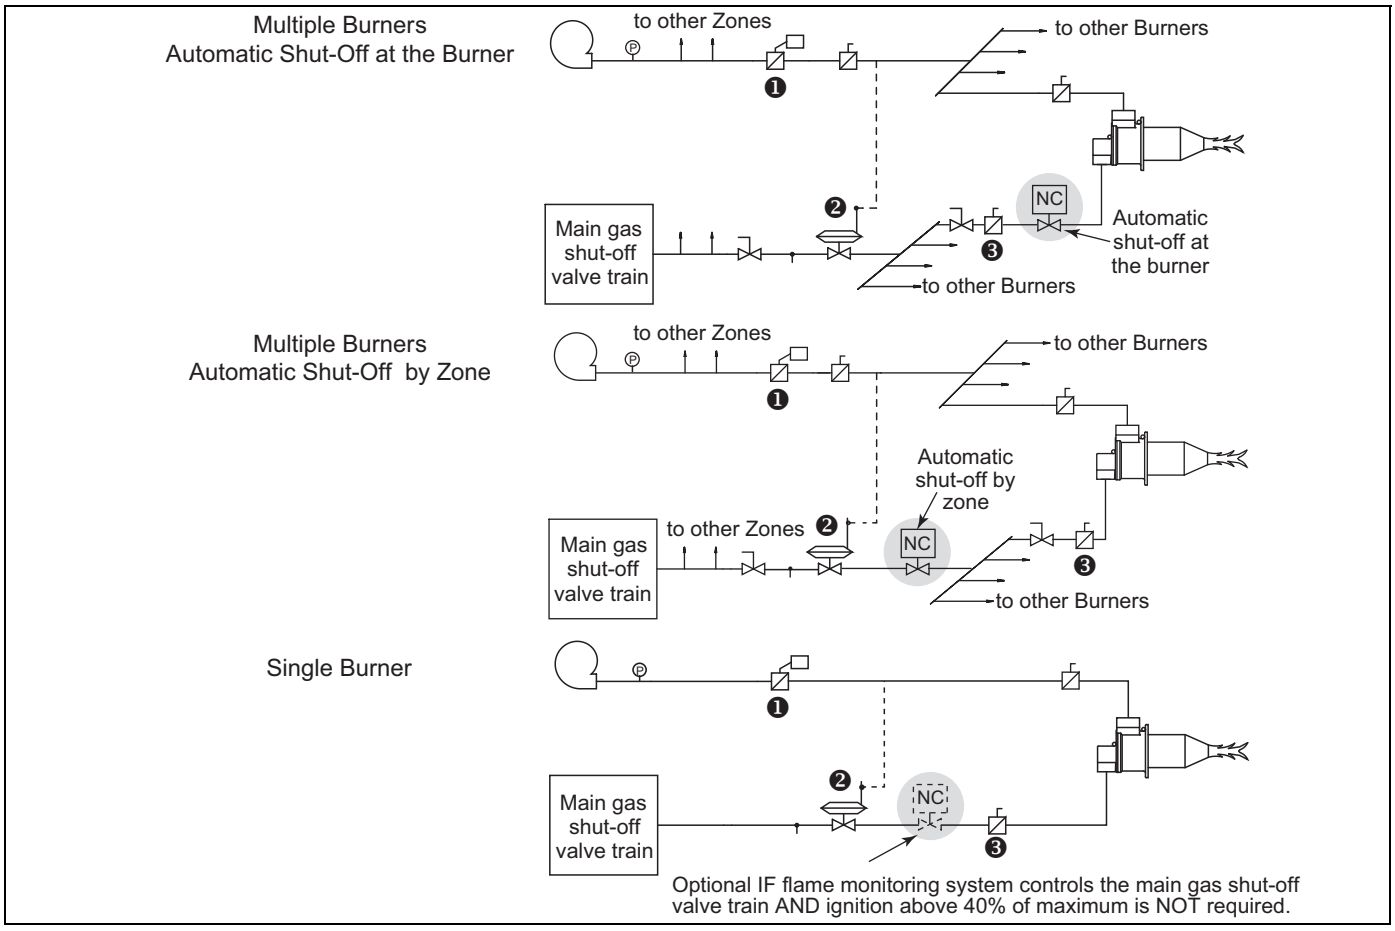

Figure 3.1 Modulating Gas & Air (On-Ratio Control or Excess Air @ Low Fire)

Modulating Gas with Fixed-Air Control (Figure 3.2)

A burner system with modulating control gives an input that is in proportion with the demands of the process. ANY input between high and low fire is possible.

1. Air:

   The amount of air to the burner is fixed.

2. Gas:

   The control valve ❶ is in the gas line. It can modulate to any position between low and high fire.

NOTE: Use of a ratio regulator ❷ in a fixed-air system is optional on a single burner system only. However, eliminating the ratio regulator will adversely affect the ignition reliability at inputs greater than 40% of maximum.

High/Low Air & Gas Control (Pulse Firing) (Figure 3.3)

A burner system with high/low control gives a high or low fire input to the process. No input between high and low fire is possible.

1. Air:

   a. Low fire: A control input closes the solenoid valve ❹. As a result the CRS valve ❺ quickly moves to low fire.

   b. High fire: A control input opens the solenoid valve ❹. As a result the CRS valve ❺ quickly moves to high fire.

2. Gas:

   a. Low fire: A control input closes the solenoid valve ❶. Low fire gas passes through the butterfly valve ❸.

   b. High fire:A control input opens the solenoid valve ❶.

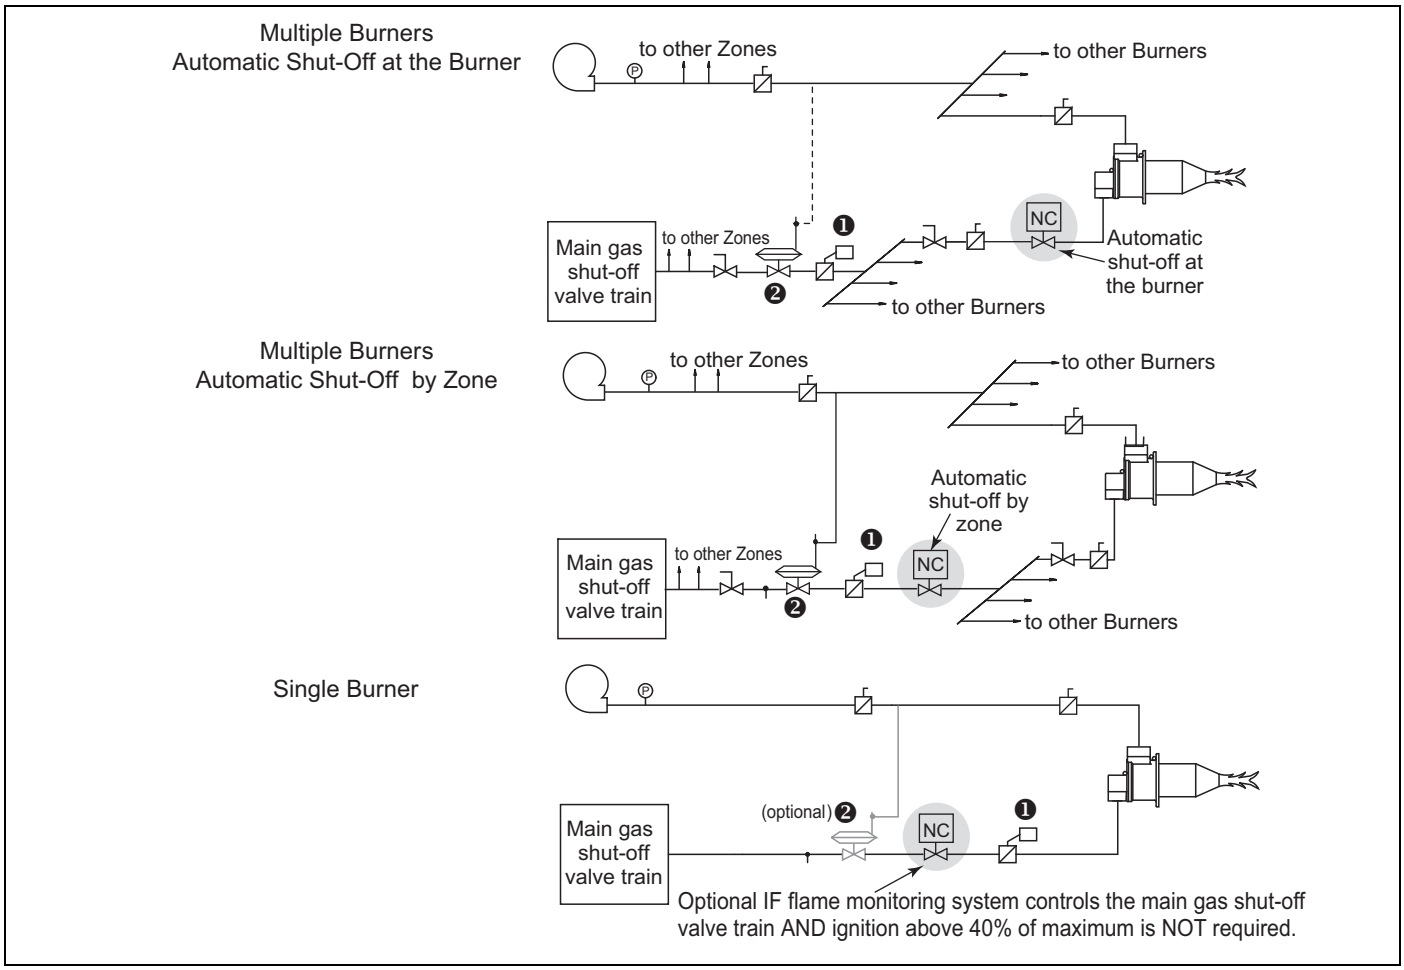

Figure 3.2 Modulating Gas with Fixed-Air Control

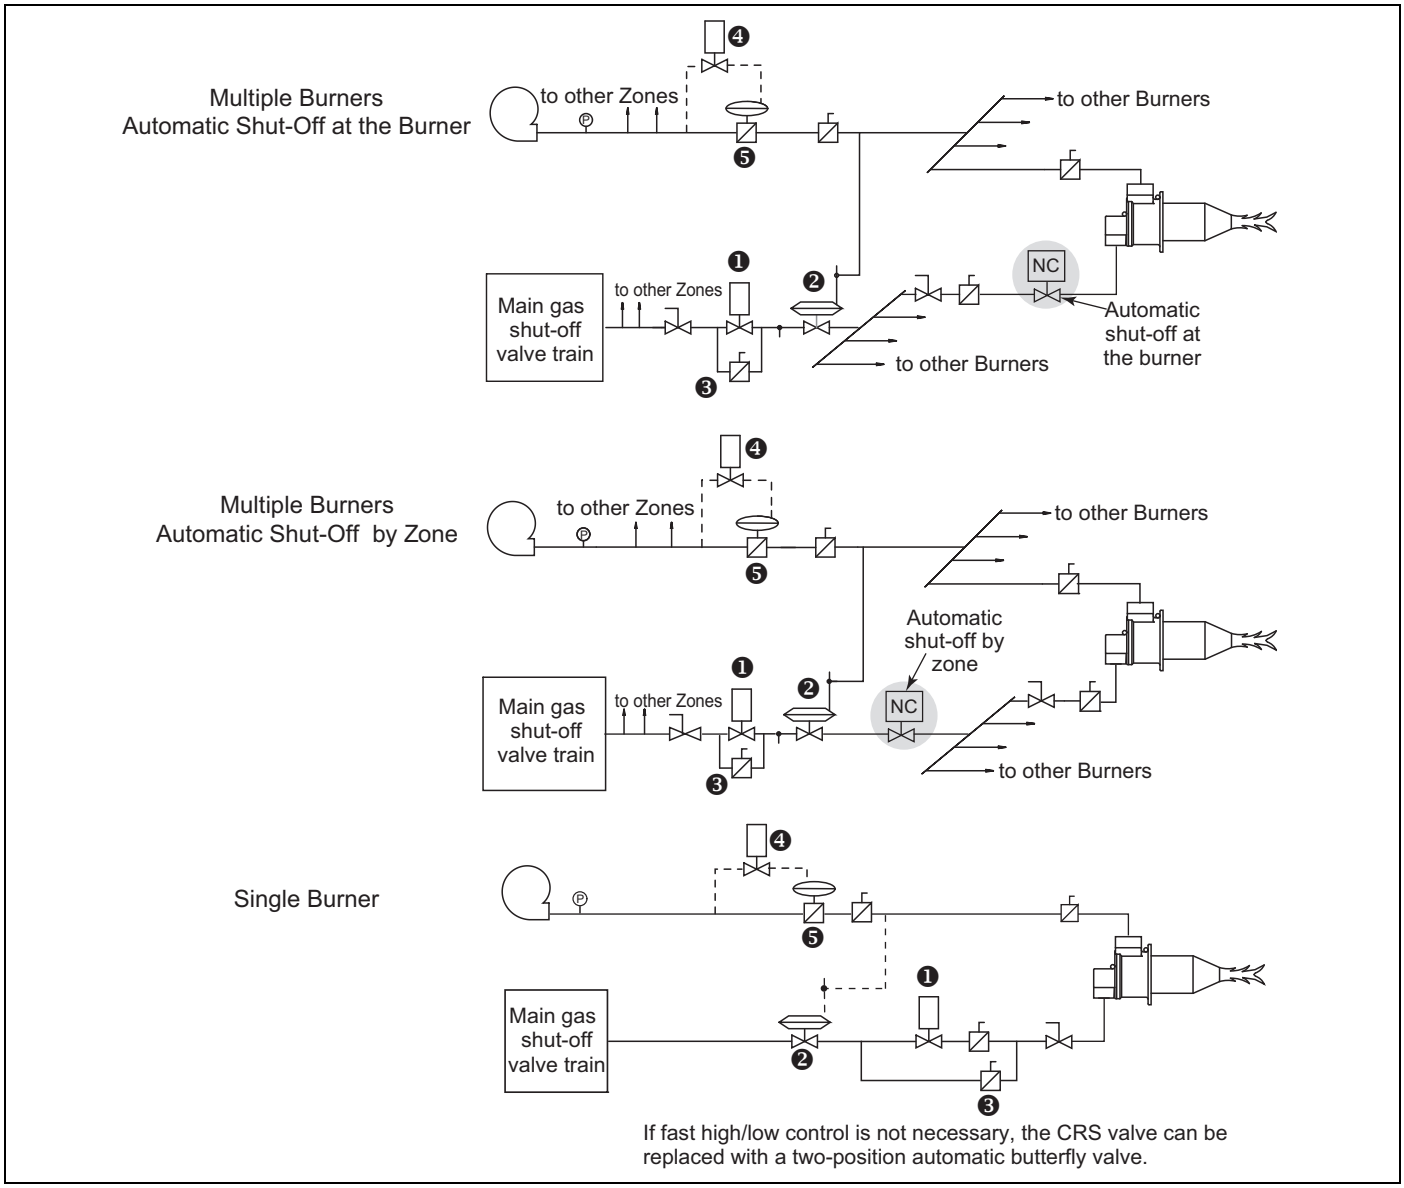

Figure 3.3 High/Low Air & Gas Control (Pulse Firing)

High/Low Gas with Fixed-Air Control

(Can also be used for pulse firing.)

A burner system with high/low control gives a high or a low input to the process. NO input between high and low fire is possible.

1. Air:

   The amount of air to the burner is fixed.

2. Gas:

   a. Low fire: A control input closes the solenoid valve ❶. Low fire gas passes through the butterfly valve ❸.

   b. High fire: A control input opens the solenoid valve ❶. High fire gas passes through the open solenoid valve ❶.

NOTE: Use of a ratio regulator ❷ in a fixed-air system is optional on a single burner system only. However, eliminating the ratio regulator will adversely affect the ignition reliability at inputs greater than 40% of maximum.

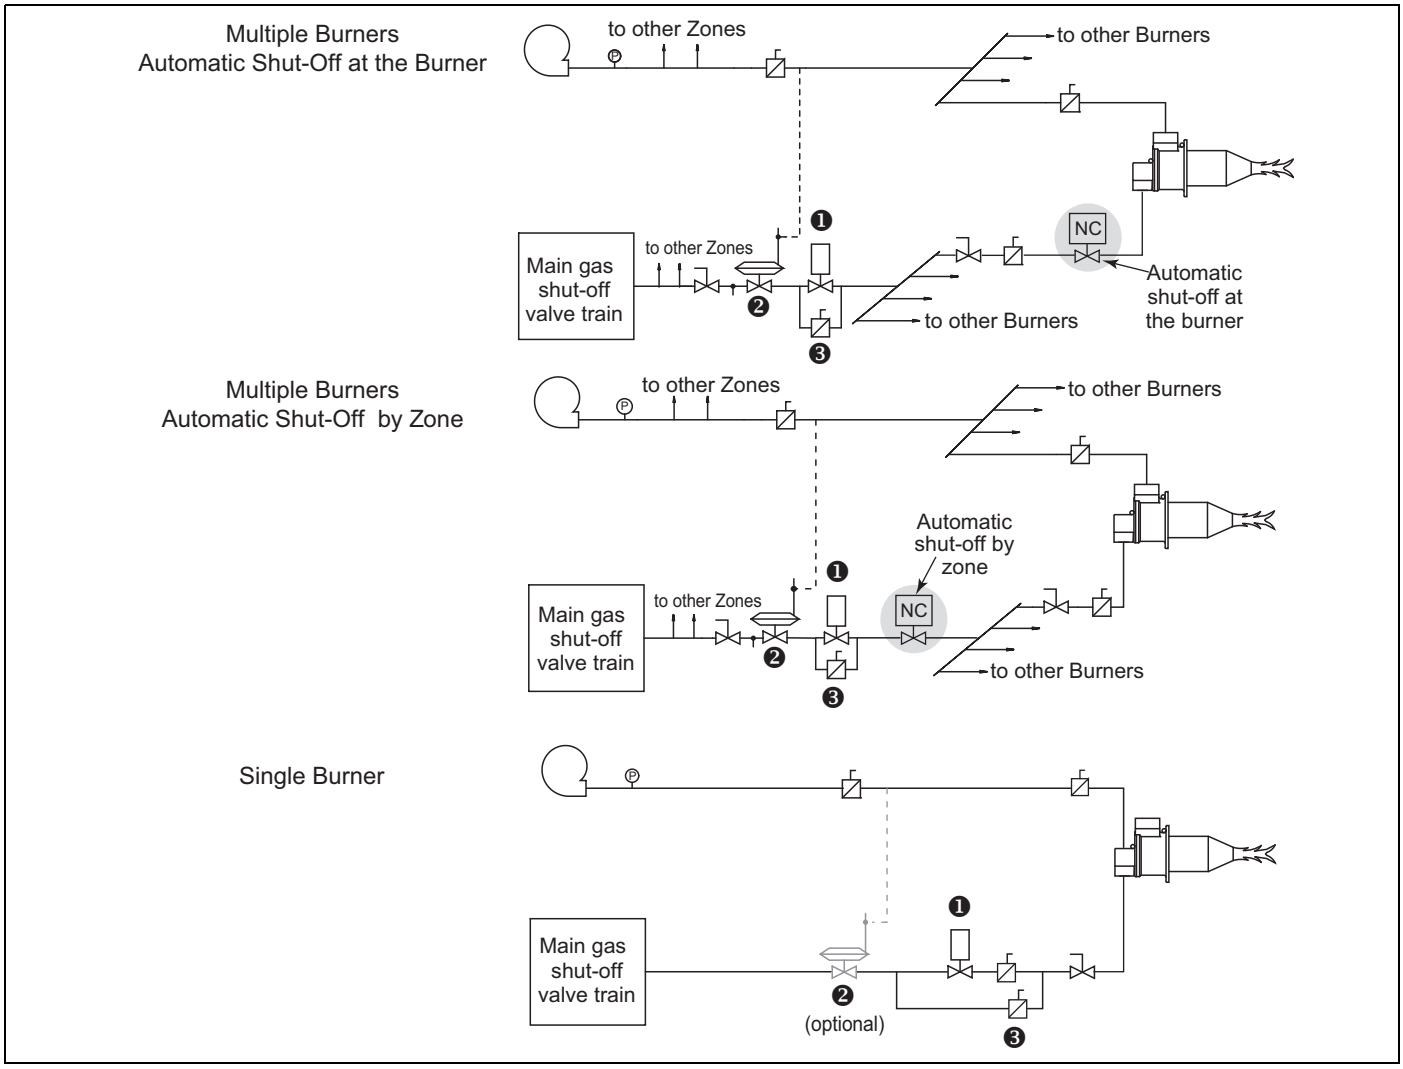

Figure 3.4 High/Low Gas with Fixed-Air Control

Step 3: Ignition System

For the ignition system use:

- 6,000 VAC transformer
- Full-wave spark transformer
- One transformer per burner

DO NOT USE:

- 10,000 VAC transformer
- Twin outlet transformer
- Distributor type transformer
- Half-wave transformer

It is recommended that low fire start be used, however, ThermJet burners are capable of direct spark ignition anywhere within the operating range.

NOTE: You must follow the control circuits described in the previous section, “Control Methodology,” to obtain reliable ignition.

Local safety and insurance require limits on the maximum trial for ignition time. These time limits vary from country to country.

The time it takes for a burner to ignite depends on:

- The distance between the gas shut-off valve and the burner.
- The air/gas ratio.
- The gas flow at start conditions.

It is possible to have the low fire too low to ignite within the trial for ignition period. Under these circumstances you must consider the following options:

- Start at higher input levels.
- Resize and/or relocate the gas controls.
- Use bypass start gas. (See the circuit schematics on the next page.)

Bypass Start Gas (Optional) (Figure 3.5)

A bypass start gas circuit provides gas flow around zone gas control valves during the trial for ignition period. This should only be used if excess air (proportional or fixed air control) is being used on low fire; it should NOT be used with on-ratio low fire systems.

During the trial for ignition period, the solenoid valve in the bypass line plus the automatic gas shut-off valve (either at each burner or each zone) are opened. If a flame is established, the bypass solenoid valve closes at the end of the trial for ignition period. If a flame is not established, then the bypass solenoid valve and the automatic gas shut-off valve close.

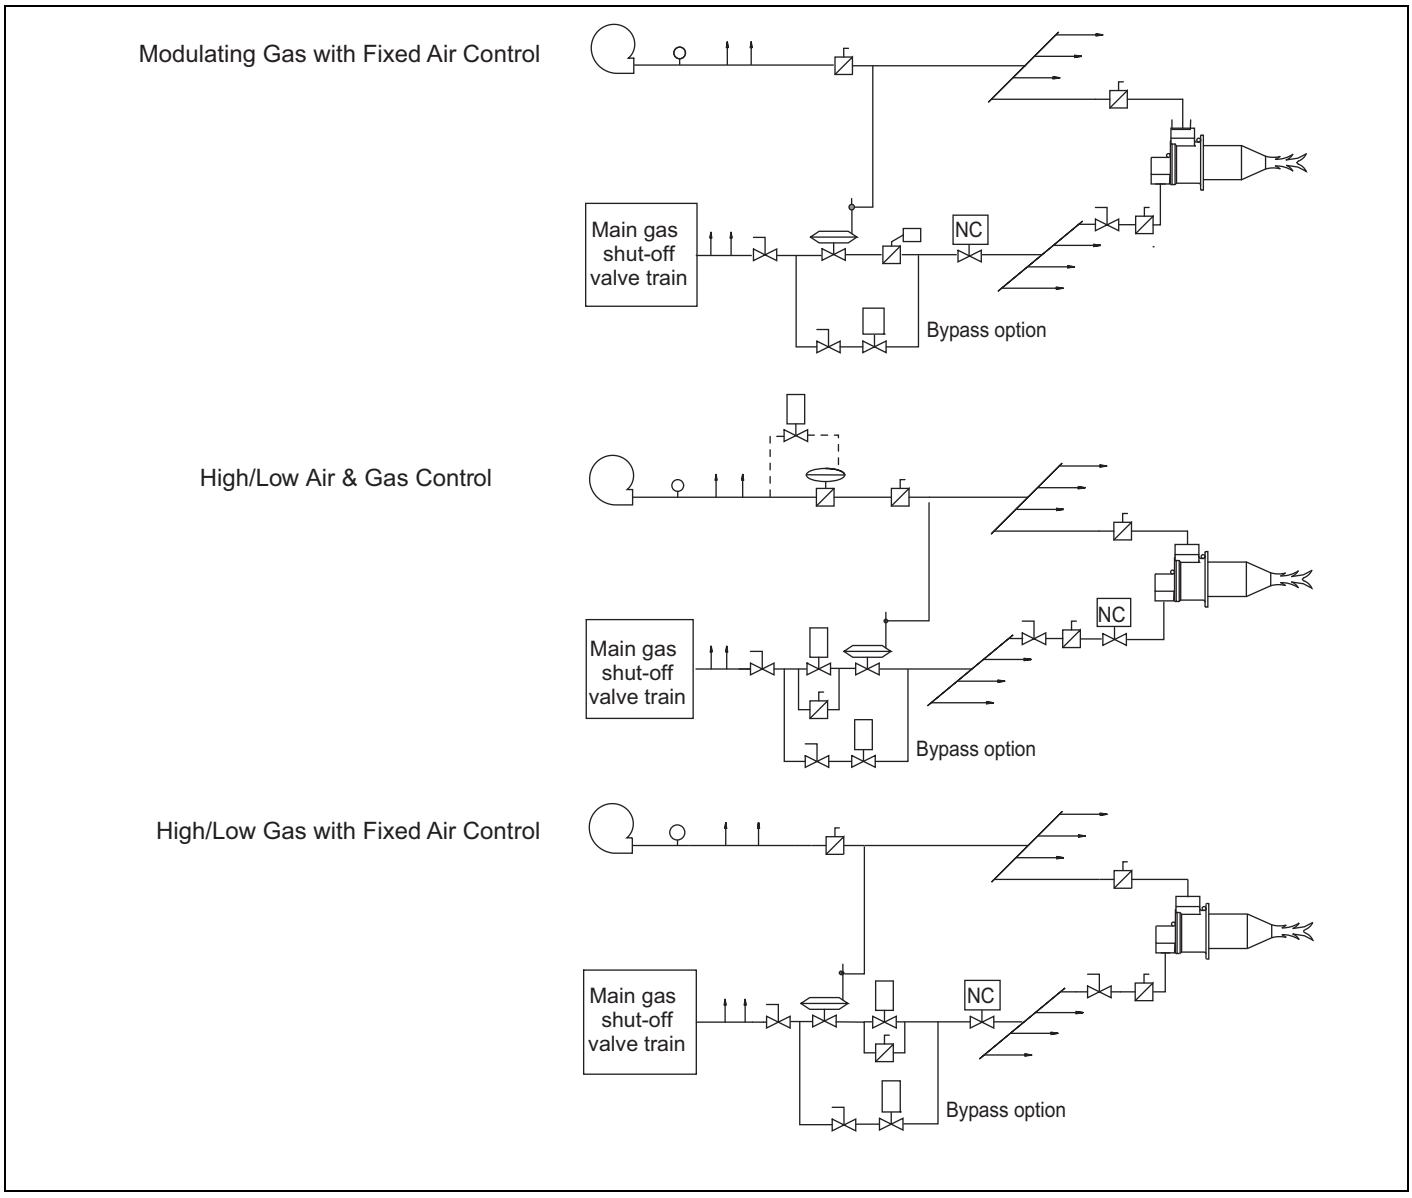

Figure 3.5 Bypass Start Gas Circuit Schematics

Step 4: Flame Monitoring System

A flame monitoring system consists of two main parts:

- A flame sensor
- Flame monitoring control

Flame Sensor

There are two types that you can use for a ThermJet burner:

- UV scanner
- Flame rod

A UV scanner can be used with all combustor types.

The UV scanner must be compatible to the flame monitoring control that is used. Refer to the manual of your selected control for proper selection of the scanner.

NOTE: Flame rod option is not available for the TJ300 and larger.

- The standard flame rod is used with natural gas and pre-heated air up to 300ºF.
- The high-grade flame rod is used with propane, butane, and preheated air up to 700ºF.

You can find more information in Info Guide 832.

Flame Monitoring Control

The flame monitoring control is the equipment that processes the signal from the flame rod or the UV scanner. For flame monitoring control you may select several options:

- Flame monitoring control for each burner (if one burner goes down, only that burner will be shut off)
- Multiple-burner flame monitoring control (if one burner goes down, all burners will be shut off)

Eclipse recommends the following:

- Trilogy series T400; see Instruction Manual 830
- Bi-flame series; see instruction manual 826
- Multi-flame series 6000; see Instruction Manual 820
- Veri-flame; see Instruction Manual 818

If other controls are considered, contact Eclipse to determine how burner performance may be affected. Flame monitoring controls that have lower sensitivity flame detecting circuits may limit burner turndown and change the requirements for ignition. Flame monitoring controls that stop the spark as soon as a signal is detected may prevent establishment of flame, particularly when using UV scanners. The flame monitoring control must maintain the spark for a fixed time interval that is long enough for ignition.

DO NOT USE the following:

- Flame monitoring relays which interrupt the trial for ignition when the flame is detected
- Flame sensors which supply a weak signal
- Flame monitoring relays with low sensitivity

⚠ WARNING

- **A UV scanner can possibly detect another burner's flame if it is in the line of sight, and falsely indicate flame presence. Use a flame rod in this situation. This helps prevent accumulation of unburned fuel which, in extreme situations, could cause a fire or an explosion.**

Step 5: Combustion Air System: Blower & Air Pressure Switch

Effects of Atmospheric Conditions

The blower data is based on the International Standard Atmosphere (ISA) at Mean Sea Level (MSL), which means that it is valid for:

- Sea level
- 29.92" Hg (1,013 mbar)
- 70ºF (21ºC)

The makeup of the air is different above sea level or in a hot area. The density of the air decreases, and as a result, the outlet pressure and the flow of the blower decrease. An accurate description of these effects is in the Eclipse Combustion Engineering Guide (EFE 825). The Guide contains tables to calculate the effect of pressure, altitude and temperature on air.

Blower

The rating of the blower must match the system requirements. You can find all the blower data in: Bulletin/ Info Guide 610.

Follow these steps:

1. Calculate the outlet pressure.

   When calculating the outlet pressure of the blower, the total of these pressures must be calculated.

   - The static air pressure required at the burner
   - The total pressure drop in the piping
   - The total of the pressure drops across the valves
   - The pressure in the chamber (suction or pressurized)
   - Recommend a minimum safety margin of 10%

2. Calculate the required flow:

   The blower output is the air flow delivered under standard atmospheric conditions. It must be enough to feed all the burners in the system at high fire.

Combustion air blowers are normally rated in terms of standard cubic feet per hour (SCFH) of air. An example calculation follows the informations tables below:

Table 3.1 Required Calculation Information

Description	Unit of Measure	Formula Symbol
Number of burners	-	-
Type of fuel	-	-
Gross heating value of fuel	Btu/ft^3 (MJ/m^3)	q
Desired excess air percentage (Typical excess air percentage @ high fire is 15%)	percent	%
Air/Gas ratio (Fuel specific, see table below)	-	α
Air flow	scfh (Nm^3/hr)	V_{air}
Gas flow	scfh (Nm^3/hr)	V_{gas}

Table 3.2 Fuel Gas Heating Values

Fuel Gas	Stoichiometric* Air/Gas Ratio α(ft^3_{air}/ft^3_{gas})	Gross Heating Value q (Btu/ft^3)
Natural Gas (Birmingham, AL)	9.41	1,002 (40 MJ/m^3)
Propane	23.82	2,564 (102,5 MJ/m^3)
Butane	30.47	3,333(133,3 MJ/m^3)

*Stoichiometric: No excess air. The precise amount of air and gas are present for complete combustion.

Example Blower Calculation

A batch furnace requires a gross heat input of 2,900,000 Btu/hr (based on 45% efficiency). The designer decides to provide the required heat input with four burners operating on natural gas using 15% excess air.

Calculation Example:

a. Decide which ThermJet burner model is appropriate:

$$\frac{\text{Q (total heat input) of 2,900,000 Btu/hr}}{\text{4 burners}} = \frac{\text{725,000}}{\text{Btu/hr/burner}}$$

- Select 4 model TJ0075 ThermJet burners based on the required heat input of 725,000 Btu/hr for each burner.

b. Calculate required gas flow:

$$V_{gas} = \frac{Q}{q} = \frac{2{,}900{,}000 \text{ Btu/hr}}{1{,}002 \text{ Btu/ft}^3} = 2{,}894 \text{ ft}^3\text{/hr}$$

- Gas flow of 2,894 ft^3/hr is required.

c. Calculate required stoichiometric air flow:

$$V_{air\text{-}stoichiometric} = \alpha \text{ (air/gas ratio)} \times V_{gas}$$

$$= 9.41 \times 2{,}894 \text{ ft}^3\text{/hr} = 27{,}235 \text{ ft}^3\text{/hr}$$

- Stiochiometric air flow of 27,235 SCFH required.

d. Calculate final blower air flow requirement based on the desired amount of excess air:

$$V_{air} = (1 + \text{excess air\%}) \times V_{air\text{-}stoichiometric}$$

$$= (1 + 0.15) \times 27{,}235 \text{ ft}^3\text{/hr} = 31{,}320 \text{ ft}^3\text{/hr}$$

- For this example, final blower air flow requirement is 31,320 SCFH at 15% excess air.

NOTE: It is common practice to add an additional 10% to the final blower air flow requirement as a safety margin.

1. Find the blower model number and motor horsepower (hp). With the output pressure and the specific flow, you can find the blower catalog number and the motor hp in Bulletin 610.
2. Eclipse recommends that you select a totally enclosed fan cooled (TEFC) motor.
3. Select the other parameters:
   - inlet filter or inlet grille
   - Inlet size (frame size)
   - voltage, number of phases, frequency
   - blower outlet location, and rotation direction clockwise (CW) or counter-clockwise (CCW).

NOTE: The use of an inlet air filter is strongly recommended. The system will perform longer and the settings will be more stable.

NOTE: When selecting a 60 Hz Blower for use on 50 Hz, a pressure and capacity calculation is required. See Eclipse Engineering Guide (EFE 825).

The total selection information you should now have:

- blower model number
- motor hp
- motor enclosure (TEFC)
- voltage, number of phases, frequency
- outlet position and rotation direction (CW or CCW)

Air Pressure Switch

The air pressure switch gives a signal to the monitoring system when there is not enough air pressure from the blower. You can find more information on pressure switches in Blower Bulletin 610.

WARNING

- **Eclipse supports NFPA and EN regulations, which require the use of an air pressure switch in conjunction with other safety components, as a minimum standard for main gas safety shut-off systems.**

Step 6: Main Gas Shut-Off Valve Train

Consult Eclipse

Eclipse can help you design and obtain a main gas shut-off valve train that complies with the current safety standards.

The shut-off valve train must comply with all the local safety standards set by the authorities that have jurisdiction.

For details, please contact your local Eclipse representative or Eclipse.

NOTE: Eclipse supports NFPA regulations (two shut-off valves) as a minimum standard for main gas safety shut-off systems.

Step 7: Process Temperature Control System

The process temperature control system is used to control and monitor the temperature of the system. There is a wide variety of control and measuring equipment available.

For details, please contact your Eclipse.

Key to System Schematics

Symbol	Appearance	Name	Remarks	Bulletin/ Info Guide
		ThermJet Burner		
		Main Gas Shut-Off Valve Train	Eclipse strongly endorses NFPA as a minimum.	756
		Combustion Air Blower	The combustion air blower provides the combustion air pressure to the burner(s).	610
		Air Pressure Switch	The air pressure switch gives a signal to the safety system when there is not enough air pressure from the blower.	610
		Gas Cock	Gas cocks are used to manually shut off the gas supply on both sides of the main gas shut-off valve train.	710
		Solenoid Valves (normally closed)	Solenoid valve automatically shut off the gas supply on a bypass gas system or on small capacity burner systems.	760
		Manual Butterfly Valve	Manual butterfly valves are used to balance the air or gas flow at each burner, and/or to control the zone flow.	720
		Automatic Butterfly Valve	Automatic butterfly valves are typically used to set the output of the system.	720
		Ratio Regulator	A ratio regulator is used to control the air/gas ratio. The ratio regulator is a sealed unit that adjusts the gas flow in ratio with the air flow. To do this, it measures the air pressure with a pressure sensing line, the impulse line. This impulse line is connected between the top of the ratio regulator and the air supply line. The cap must stay on the ratio regulator after adjustment.	742
		CRS Valve	A CRS valve is used in a high/low time-proportional control system to quickly open and close the air supply.	744
		Pressure Taps	The schematics show the advised positions of the pressure taps.	
		Impulse Line	The impulse line connects the ratios regulator to the air supply line.

In accordance with the manufacture's policy of continual product improvement, the product presented in this brochure is subject to change without notice or obligation.

The material in this manual is believed adequate for the intended use of the product. If the product is used for purposes other than those specified herein, confirmation of validity and suitability must be obtained. Eclipse warrants that the product itself does not infringe upon any United States patents. No further warranty is expressed or implied.

Liability & Warranty

We have made every effort to make this manual as accurate and complete as possible. Should you find errors or omissions, please bring them to our attention so that we may correct them. In this way we hope to improve our product documentation for the benefit of our customers. Please send your corrections and comments to our Marketing Communications Manager.

It must be understood that Eclipse's liability for its product, whether due to breach of warranty, negligence, strict liability, or otherwise is limited to the furnishing of replacement parts and Eclipse will not be liable for any other injury, loss, damage or expenses, whether direct or consequential, including but not limited to loss of use, income, or damage to material arising in connection with the sale, installation, use of, inability to use, or the repair or replacement of Eclipse's products.

Any operation expressly prohibited in this manual, any adjustment, or assembly procedures not recommended or authorized in these instructions shall void the warranty.

Document Conventions

There are several special symbols in this document. You must know their meaning and importance.

The explanation of these symbols follows below. Please read it thoroughly.

How To Get Help

If you need help, contact your local Eclipse representative. You can also contact Eclipse at:

1665 Elmwood Rd.
Rockford, Illinois 61103 U.S.A.
Phone: 815-877-3031
Fax: 815-877-3336

Introduction 1

Product Description

The ThermJet is a nozzle-mix burner that is designed to fire an intense stream of hot gases through a combustor using ambient combustion air.

The high velocity of the gases improves temperature uniformity, product quality and system efficiency.

The ThermJet burner comes in two types:

- High Velocity (HV)
- Medium Velocity (MV)

The gas velocity can be as high as 500 ft/s for the High Velocity burner, and 250 ft/s for the Medium Velocity burner.

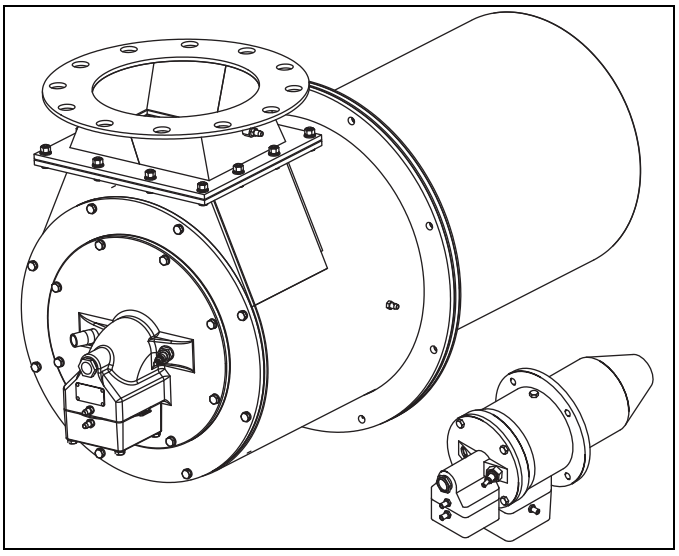

Figure 1.1. ThermJet Burner

Audience

This manual has been written for people who are already familiar with all aspects of a nozzle-mix burner and its add-on components, also referred to as “the burner system”.

These aspects are:

- Installation
- Use
- Maintenance

The audience is expected to have previous experience with this type of equipment.

ThermJet Documents

Installation Guide No. 205

- This document

Datasheet, Series No. 205-1 through 205-13

- Available for individual ThermJet models
- Required to complete installation

Design Guide No. 205

- Used with Datasheet to complete installation

Related Documents

- EFE 825 (Combustion Engineering Guide)
- Eclipse Bulletins and Info Guides: 610, 710, 720, 730, 742, 744, 760, 930, I-354

Purpose

The purpose of this manual is to ensure that you carry out the installation of a safe, effective, and trouble free combustion system.

Safety

2

Important notices about safe burner operation will be found in this section. Read this entire manual before attempting to start the system. If any part of the information in this manual is not understood, contact Eclipse before continuing.

Safety

DANGER

- **The burners covered in this manual are designed to mix fuel with air and burn the resulting mixture. All fuel burning devices are capable of producing fires and explosions when improperly applied, installed, adjusted, controlled or maintained.**
- **Do not bypass any safety feature. Fires and explosions can be caused.**
- **Never try to light the burner if the burner shows signs of damage or malfunctioning.**

WARNING

- **The burner might have HOT surfaces. Always wear protective clothing when approaching the burner.**
- **Eclipse products are designed to minimize the use of materials that contain crystalline silica. Examples of these chemicals are: respirable crystalline silica from bricks, cement or other masonry products and respirable refractory ceramic fibers from insulating blankets, boards, or gaskets. Despite these efforts, dust created by sanding, sawing, grinding, cutting, and other construction activities could release crystalline silica. Crystalline silica is known to cause cancer, and health risks from the exposure to these chemicals vary depending on the frequency and length of exposure to these chemicals. To reduce this risk, limit exposure to these chemicals, work in a well-ventilated area and wear approved personal protective safety equipment for these chemicals.**

NOTICE

- **This manual provides information in the use of these burners for their specific design purpose. Do not deviate from any instructions or application limits described herein without written advice from Eclipse.**
- **Read entire manual before attempting to start this system. If you do not understand any part of the information contained in this manual, contact Eclipse before continuing.**

Capabilities

Adjustment, maintenance and troubleshooting of the mechanical and the electrical parts of this system should be done by qualified personnel with good mechanical aptitude and experience with combustion equipment.

Operator Training

The best safety precaution is an alert and trained operator. Train new operators thoroughly and have them demonstrate an adequate understanding of the equipment and its operation. A regular retraining schedule should be administered to ensure operators maintain a high degree of proficiency.

Replacement Parts

Order replacement parts from Eclipse only. All Eclipse approved, customer supplied valves or switches should carry UL, FM, CSA, CGA, and/or CE approval, where applicable.

Installation 3

In this section you will find the information and instructions that you need to install the burner.

Handling

- Make sure that the area is clean.
- Protect the components from the weather, damage, dirt and moisture.
- Protect the components from excessive temperatures and humidity.
- Take care not to drop or damage components.

Storage

- Make sure that the components are clean and free of damage.
- Store the components in a cool, clean, dry room.
- After you have made sure that everything is present and in good condition, keep the components in the original package as long as possible.

NOTICE

- **When the refractory combustion block is supplied with the burner, it is critical that the instructions for handling and storage are followed. The refractory should be considered fragile; improper handling and storage will cause premature failure.**

Position of Components

The position and amount of components are determined by the kind of control method chosen. All the control methods can be found in Design Guide 248. Follow one of the schematics in the System Design chapter to build your system.

Approval of Components

Limit Controls & Safety Equipment

All limit controls and safety equipment must comply with all applicable local codes and/or standards and must be listed for combustion safety by an independent testing agency. Typical application examples include:

- American: NFPA 86 with listing marks from UL, FM, CSA
- European: EN 746-2 with CE mark from TuV, Gastec, Advantica

Electrical Wiring

All the electrical wiring must comply with all applicable local codes and/or standards such as:

- NFPA Standard 70
- IEC60364
- CSA C22
- BS7671

Gas Piping

All the gas piping must comply with all applicable local codes and/or standards such as:

- NFPA Standard 54
- ANSI Z223
- EN 746-2

Where to Get the Standards:

The NFPA Standards are available from:
National Fire Protection Agency
Batterymarch Park
Quincy, MA 02269
www.nfpa.org

The ANSI Standards are available from:
American National Standard Institute
1430 Broadway

Checklist Before Installation

Intake

To admit fresh combustion air from outdoors, provide an opening in the room of at least one square inch per 4,000 BTU/hr. If there are corrosive fumes or materials in the air, then supply the burner with clean air from an uncontaminated area, or provide a sufficient air filtering system.

Exhaust

Do not allow exhaust to accumulate in the work area. Provide some positive means for exhausting them from the furnace and the building.

Access

Make sure that you install the burner in such a way that you can get easy access for inspection and maintenance.

Environment

Make sure the local environment matches the original operating specifications. Check the following items:

- Voltage, frequency and stability of the electrical power
- Type and supply pressure of the fuel
- Availability of enough fresh, clean combustion air
- Humidity, altitude and temperature of air
- Presence of damaging corrosive gases in the air

Prepare the Burner

Several components must be installed on a burner before it can operate. Installation instructions follow.

It is possible to change the relative position of the gas inlet with respect to the air inlet. This can be convenient for the routing of the piping.

Rotate the Rear Cover (Optional)

To rotate the rear cover, do the following (see Figure 3.1):

1. Disconnect the piping at a union in the piping or the inlet flanges ❶ provided on the burner.

NOTE: Be careful not to lose or damage the orifice plate or the o-rings.

2. Remove the four bolts ❷.
3. Remove the rear cover ❸ from the burner housing ❹.
4. Rotate the rear cover ❸ to the position that you want.
5. Put the rear cover ❸ in position against the burner housing ❹.
6. Install the four bolts ❷.
7. Reconnect the piping. Make sure that the o-rings show no signs of damage.

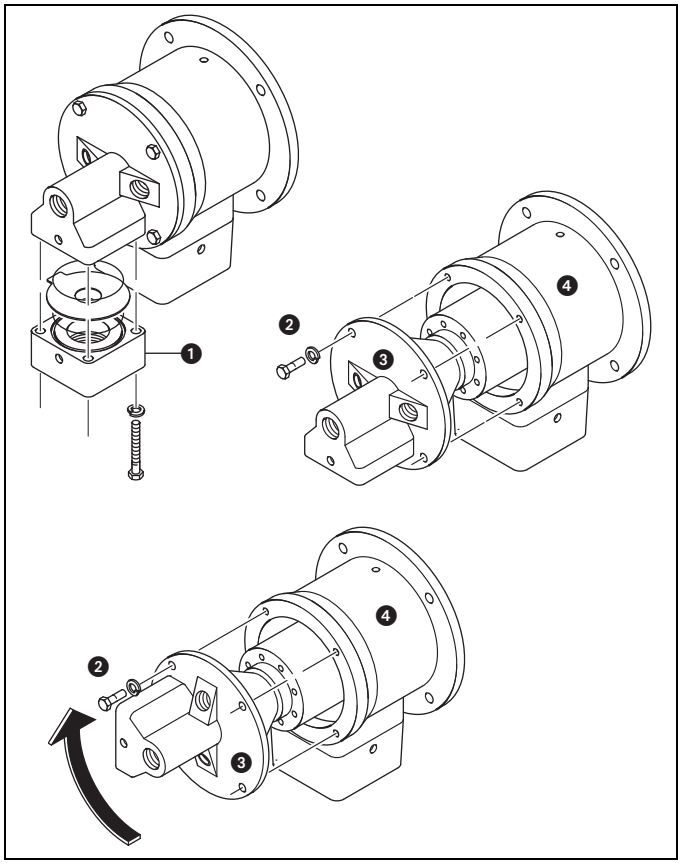

Figure 3.1. Rotate the Rear Cover

Installing the Flame Sensor

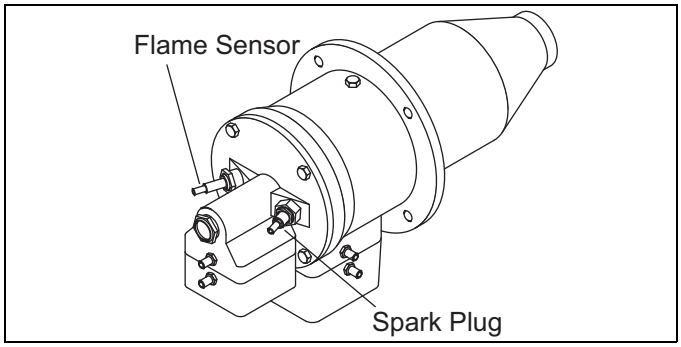

Figure 3.2. Installing the Flame Sensor

1. Install the flame sensor into the 1/2" NPT opening in the rear cover.

2. Make sure that you connect the flame sensor of a burner to the electrical circuit of that burner.

⚠ DANGER

- **If you connect the flame sensor of a burner to the electrical circuit of the wrong burner, then you can cause fires and explosions.**

There are two different types of flame sensors; UV scanner and flamerod.

NOTICE

- **Adjustments may vary from Eclipse published values if the flame controls other than those recommended in the Design Guide are used. Consult with the engineer who specified the alternate control for limitations.**

UV Scanner

For detailed information on how to install and connect a UV scanner, refer to scanner information guide.

Flame Rod

NOTE: Only specific burner sizes with alloy or silicon carbide combustors can use a flamerod (see specific burner datasheets).

For detailed information on how to install and connect a flamerod, refer to Bulletin/Info guide 832.

Installing the Spark Plug

Install the spark plug into the opening in the rear cover.

NOTE: Do ***not*** apply any grease to the threads of the spark plug. You can cause bad grounding of the spark plug if you apply grease to it. Bad grounding of the spark plug results in a weak spark.

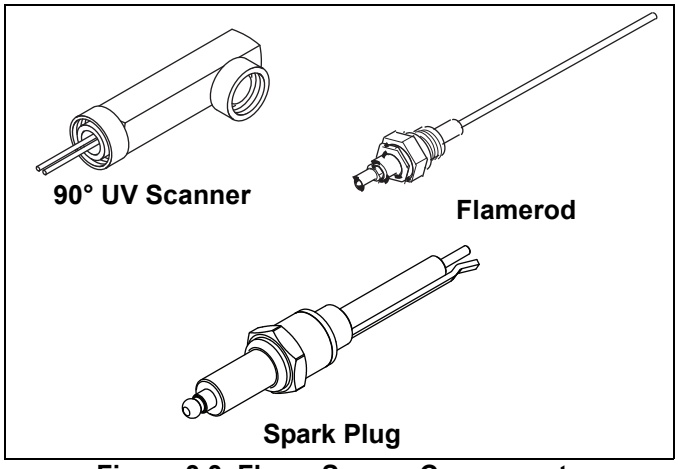

Figure 3.3. Flame Sensor Components

Burner Installation

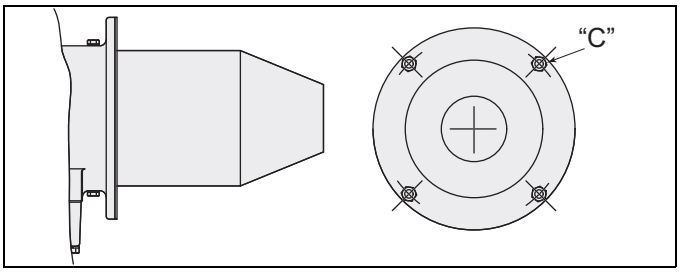

Figure 3.4. Burner Attachment

Dimensions

The burner attaches to the wall of the chamber with bolts through holes “C”. For full information on the burner dimensions, refer to specific datasheets.

Chamber Wall

Make sure that the wall of the chamber is strong enough to support the weight of the burner. If necessary, reinforce the area where you plan to install the burner to support the weight of the burner.

Refractory furnace walls must allow for thermal expansion as recommended by the refractory supplier – the wall should apply no stress on the burner block or refractory layer surrounding the burner block. Expansion joints built into the furnace wall should permit the furnace shell, burner block holder, combustor or burner block and surrounding refractory to move as a unit in the event of unequal expansion of the refractory wall and furnace shell.

The combustor or combustion block must not extend beyond the inside of the furnace wall more than 1". Beyond this length it is necessary to add a spacer on the outside of the furnace to keep the end of the combustor or combustion block within 1/2" of the end of the wall.

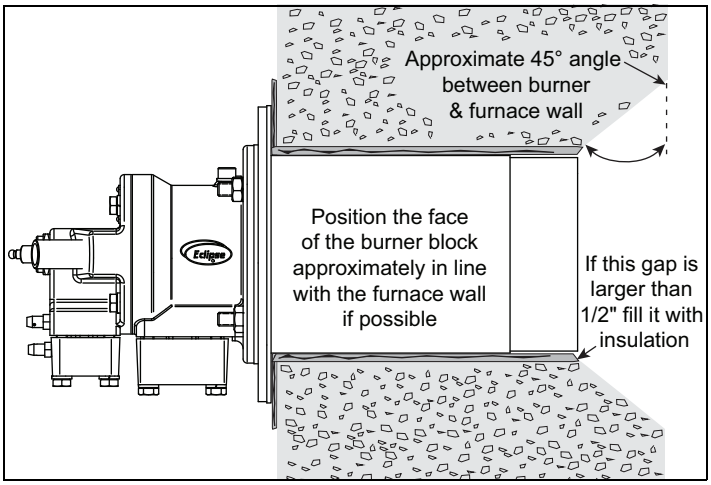

Figure 3.5. ThermJet Combustor Position

If the combustor or burner block is shorter than the furnace wall thickness the block or combustor should be recessed into the wall. To prevent refractory overheating, a 45° chamfer should be applied.

Avoid Losses

To make sure that heat does not go back to the casing of the chamber, it is important that the radial clearance around the firing tube is filled with ceramic fiber.

Alloy Combustor (Figure 3.6)

1. Make sure the gasket ❶ is installed between the burner and the chamber wall ❷.

2. Make sure that gasket ❶ does not leak.

3. Check the size of the clearance. If the gap ❸ around the firing tube is larger than 1/2", then pack the gap with ceramic fiber ❹.

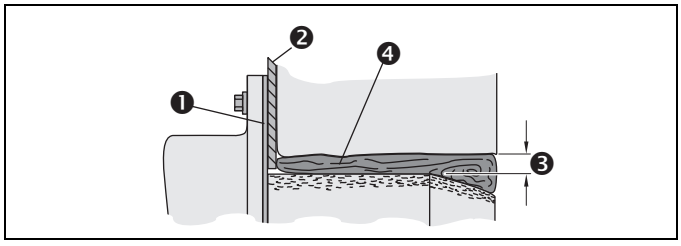

Figure 3.6. Alloy Combustor

Silicon Carbide (SiC) Combustor Only (Figure 3.7)

1. Make sure the gasket ❶ is installed between the burner flange and chamber wall ❷.

2. Make sure gasket ❺ is installed between SiC tube and flange ❻.

3. Make sure neither gasket ❶ nor ❺ leaks.

4. Check the size of the clearance. If the gap ❸ around the firing tube is larger than 1/2", pack the gap with ceramic fiber ❹ over a maximum length of 4" (100mm). Maintain a clearance of at least 3/16" (5mm) over the remaining straight length of the firing tube. Do not wrap the cone.

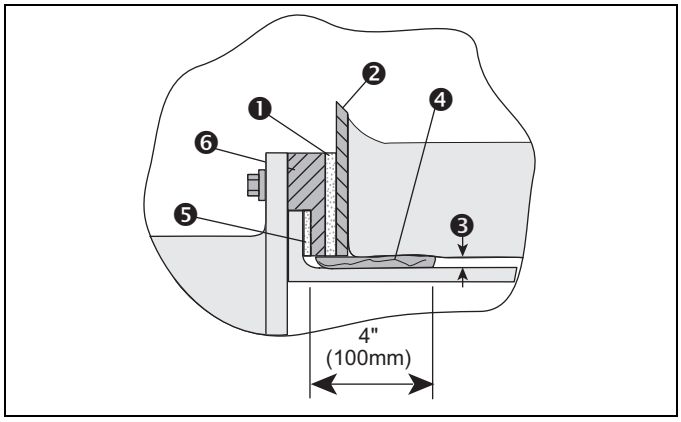

Figure 3.7. Silicon Carbide

Refractory Block (Figure 3.8)

1. Make sure gasket ❶ is installed between burner ❷ and block holder ❸.

2. Make sure gasket ❹ is installed between block holder ❸ and chamber wall ❺.

3. Support the weight of refractory block ❻ with hard brick work anchored to the furnace shell ❼. Fill the 1/2" space between block ❻ and the three unsupported sides with soft gasket material ❽.

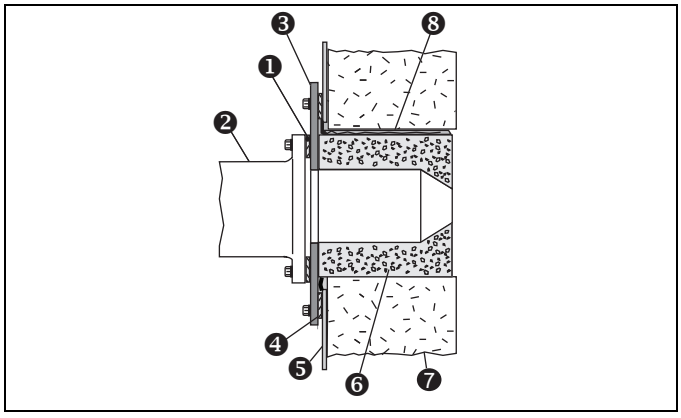

Figure 3.8. Refractory Block

Large Refractory Blocks

On sizes TJ0500 thru TJ2000; the block must be surrounded by a collar made of brick, plastic refractory, or a castable refractory of at least 4" (10 cm) minimum thickness on all sides of the block. If the collar is cast around the block, a thin plastic film (i.e. Saran Wrap® or Glad Wrap®) should be wrapped around the block to keep moisture from leaching into it. The collar should be

anchored to the furnace shell with suitable anchors and must be constructed to rest on a surface capable of supporting its weight, such as a hearth or a solid refractory or brick wall. For furnaces that are unable to support the weight of the refractory block, a stainless steel shelf can be welded to the shell to support the collar.

NOTE: All large refractory blocks are cured at a minimum temperature of 550°F (300°C) prior to shipment.

NOTE: The correct insulation of burner combustion blocks in furnaces results in longer block life and adds value by reducing downtime and maintenance.

Block Holder Temperature

Excessive block holder temperatures can cause problems. Overheating can be reduced by carefully sealing the burner blocks in the wall to prevent the leakage of hot gases back to the furnace shell.

In high temperature (>1,400°F, 760°C) fiber-wall furnace installations, the length of the metallic wrapper should extend no farther than the point in the wall where the interface temperature is higher than 1800°F (760°C).

Vertical Down Firing Blocks (Figure 3.9)

1. Down firing blocks may be suspended by customer supplied hangers ❷ attached to the burner body mounting bolts.
2. Hangers should be attached to structural support ❶.

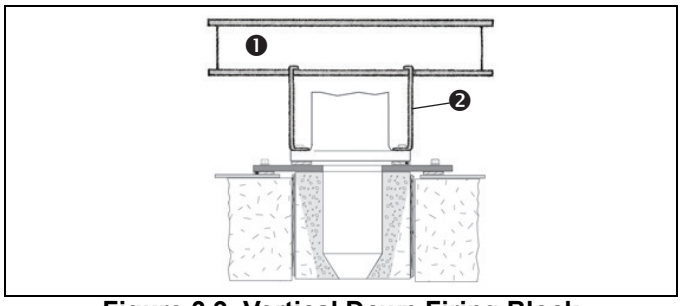

Figure 3.9. Vertical Down Firing Block

Piping Installation

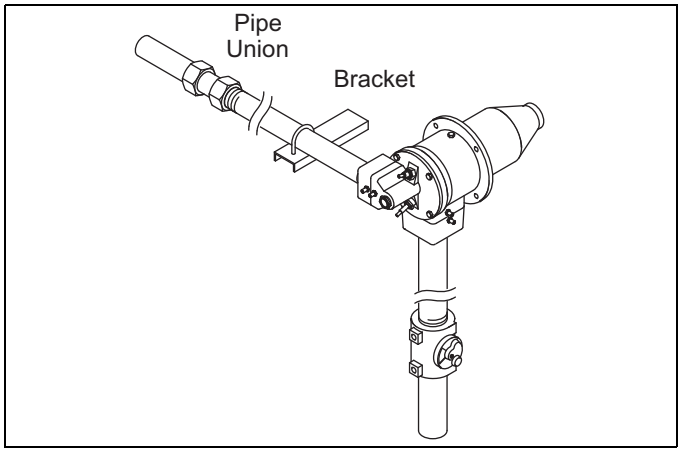

Figure 3.10. Piping Installation

Layout

Install the piping as shown in the schematics. Refer to Chapter 3 of the ThermJet Design Guide No. 205.

Support the Piping

Use brackets or hangers to support the gas piping. If you have questions, consult your local gas company.

Straight Run of Pipe Before a Metering Orifice

NOTE: There must be a run of pipe with a straight length of at least 10 pipe diameters before the burner metering orifice. If you do not do this, the pressure readings ***will*** be inaccurate.

Pipe Connections

Install a pipe union in the gas line to the burner. This simplifies removal of the burner.

The use of flexible pipe nipples in the gas line to the burner is optional. Flexible nipples can absorb stress due to heat expansion and slight misalignment.

NOTE: Flexible pipe nipples will cause inaccurate metering orifice readings and may cause higher pressure drops than equivalent standard pipe. Consider this when you size the gas lines.

Avoid Large Pressure Drops

NOTE: The pressure drop of the gas in the piping is a critical parameter. Make sure that the size of all the piping is large enough to prevent excessive pressure losses.

Valve Installation

Valve Orientation

Install all the valves in such a way that the arrow (if present) on the valve body points in the direction of flow.

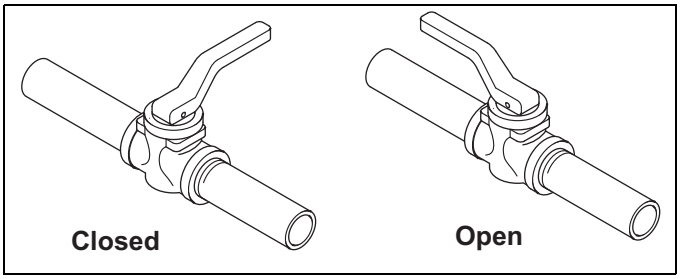

Figure 3.11. Valve Orientation

Gas Cocks

Make sure that the handle of a gas cock is at a right angle to the valve body when the valve is in the closed position. This is an important position indicator. If you do not do this, someone may think that the gas cock is in the closed position, while it is actually in the open position.

Gas Balancing Valves

A gas balancing valve is typically the same as a manual butterfly valve. For more information, refer to "Manual Butterfly Valves" below.

Manual Butterfly Valves

1. Install manual butterfly valves in accordance with Bulletin/Info Guide 720.

2. Install manual butterfly valves in the gas line to the burner (optional).

NOTE: It is recommended that there is a run of pipe with a length of at least 10 pipe diameters between any flow altering device and metering orifice on the burner.

Automatic Butterfly Valve

An automatic butterfly is driven by an actuator. Install the control valve in accordance with Bulletin/Info Guide 720.

Ratio Regulator

- Connect an impulse line to the ratio regulator and air supply line.
- Install the ratio regulator in accordance with Bulletin/Info Guide 742.

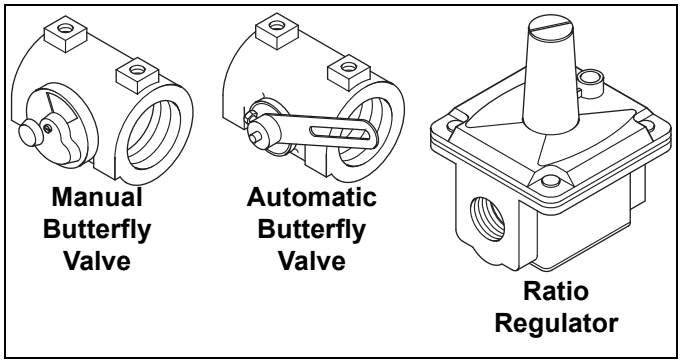

Figure 3.12. Valves

Checklist After Installation

To verify proper system installation, do the following:

1. Make sure that there are no leaks in the gas and air lines.

2. Make sure all the components of the flame monitoring control system are properly installed. This includes verifying that all switches are installed in correct locations and all wiring, pressure and impulse lines are properly connected.

3. Make sure components of spark ignition system are installed and functioning properly.

4. Make sure that the blower rotates in the correct direction. If incorrect, have a qualified electrician rewire the blower to reverse its rotation.

5. Make sure all valves are installed in the proper location and correctly oriented relative to the gas or air flow direction.

Prepare for Adjustment

After installation of the burner system components is complete, the following steps should be followed in order to prepare for adjustment:

1. Set the air pressure switch so that it drops out at 4" w.c. (10 mbar) below the pressure rating of the blower.

2. Set the low gas pressure switch at 4" w.c. (10 mbar) below the gas pressure measured at the inlet to the main gas valve train.

3. Set the high gas pressure switch so that it comes on at 4" w.c. (10 mbar) above the gas pressure measured at the inlet to the main gas valve train.

4. Close all the burner gas cocks.

5. Try to light a burner before the purge and other timers have finished their cycles. Make sure that the flame monitoring system indicates a flame failure.

6. Trip out pressure switches and other limit interlocks. Make sure that the main gas valve train closes.

⚠ DANGER

- **If simulated limits or simulated flame failures do not shut down the fuel system within the required failure response time, immediately correct the problem before proceeding.**

Adjustment, Start & Stop

4

In this chapter you will find instructions on how to adjust a system, and how to start and stop a system.

⚠ DANGER

- **Do not bypass any safety feature. You can cause fires and explosions.**

Adjustment

There are two adjustment procedures. To adjust a modulating gas and air ratio system, refer to “Modulating Gas & Air Ratio System”. For a fixed-air system, refer to “Fixed-Air System”.

Modulating Gas & Air Ratio System

If you adjust an on-ratio system for the first time, you must follow these steps: (Refer to Figures in the ThermJet Design Guide No. 205)

Step 1: Reset the System

1. Close the automatic gas valves and gas cocks.
2. Fully open the manual air butterfly valve at each burner.
   a. Drive the automatic zone air control valve to high fire.
   b. Adjust the automatic zone air control valve so that it is fully open.
3. Start the blower.

NOTICE

- **Make sure that the blower rotates in the correct direction. If incorrect, have a qualified electrician rewire the blower to reverse its rotation.**

Step 2: Set High Fire Air

1. Set the system to high fire, but **DO NOT** ignite the burner(s).
2. Use the air curves from the appropriate ThermJet datasheet to find the differential air pressure needed at high fire. This is the target value for high fire.
3. Set high fire air using the instructions for either a single burner system or multiple burner system below. (See Figure 4.1)

   To set high fire air on a single burner system:

   NOTE: A pressure tap is open when the screw inside the tap is unscrewed approximately half a turn.

   a. Make sure that pressure taps A and C are open.
   b. Connect the manometer to taps A and C (across the air orifice).
   c. Adjust the manual butterfly valve until the high fire differential air pressure is at the target value.
   d. Remove the manometer.
   e. Close the pressure taps.

   To set high fire air on a multiple burner system:

   a. Make sure that pressure taps A and C of the first burner are open.
   b. Connect the manometer to taps A and C of the first burner (across the air orifice).
   c. Adjust the zone air manual butterfly valve to achieve the target value for the first burner.
   d. Measure and note the differential air pressure across the next burner in the zone.
   e. Repeat step d for all the burners in the zone.
   f. If all the measured differential pressures are within 0.3" w.c. (0.75 mbar) of each other, then proceed to the next section. If the variation is greater than 0.3" w.c. (0.75 mbar) it will be necessary to adjust the manual air butterfly valve at each burner to improve the balance.
   g. Make sure that all the pressure taps are closed.
4. Repeat step 3 for other zones (if any).

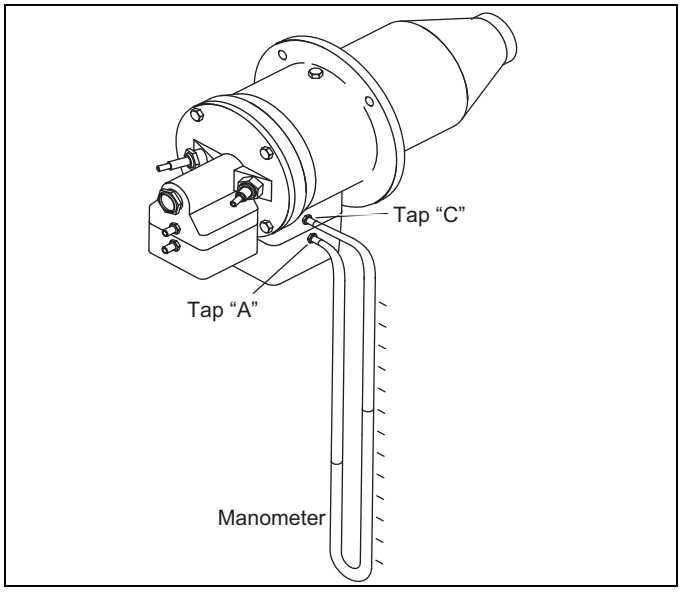

Figure 4.1. Set High Fire Air

Step 3: Set Low Fire Air

1. Set the system to low fire.
2. Connect the manometer to tap A (air inlet pressure tap).
3. Adjust the automatic zone air control valve until the low fire static air pressure is 0.2" w.c. This is the initial setting only. Further adjustment may be required.
4. Repeat 2 and 3 for the other zones (if any).

Step 4: Verify the Air Settings

Make sure all the settings are still the same after you cycle the system several times between high and low fire.

Step 5: Ignite the Burners

WARNING

- **This procedure assumes that a flame monitoring control system is installed and is serviceable. It also assumes that normal low fire start is being used. If low fire gas is too low to be used for ignition, refer to options in “Set the Bypass Pilot Gas (Optional)” on page 16.**

1. Drive the zone air automatic control valve to low fire.
2. Make sure the combustion air blower is running.
3. Set the manual gas butterfly valve at each burner to 50% open.
4. Set the adjusting screw on the ratio regulator six full (360°) turns down from the top (initial setting).

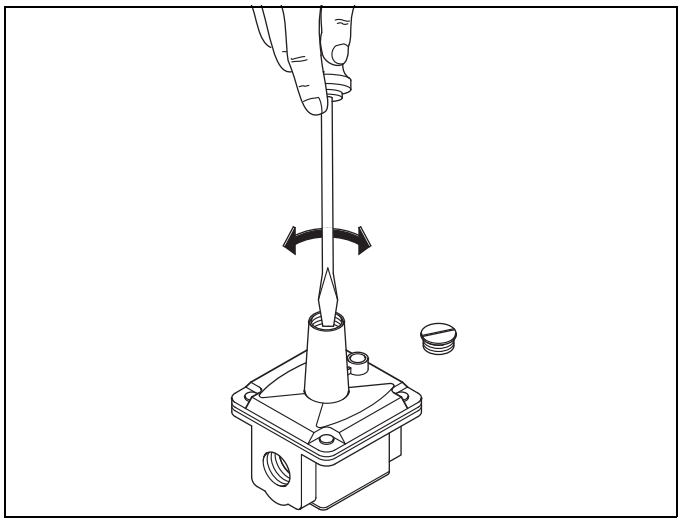

Figure 4.2. Adjusting Ratio Regulator Screw

5. Open zone manual gas cock.
6. Open manual gas cock at each burner.
7. Initiate the ignition sequence through the flame monitoring control system.
   a. Check that all the burners in the zone have ignited.
   b. If safety shut-off solenoid valves are installed at each burner, then repeat 6 and 7 for all the burners in the zone.
8. If all the burners have ignited, drive the zone air butterfly valve to high fire. Verify flame is present at each burner. If burners do not light, add a 1/2 turndown on the proportionator, and repeat steps 7 and 8.
9. Verify that air pressure drops have remained the same.
10. If air pressure drop is too high, close down the zone manual air butterfly valve.
11. If air pressure drop is too low, open the zone manual air butterfly valve.

Step 6: Set High Fire Gas (Figure 4.3)

1. Use the gas curve from the appropriate ThermJet datasheet for the gas being used to find the differential gas pressure needed at high fire. This is the target value for high fire.
2. Connect the manometer to taps B and D (across the gas orifice, see Figure 4.3).

3. Measure the high fire differential gas pressure for the first burner.

4. Adjust the gas butterfly valve at the burner until the gas flow is at the target value.

5. Repeat 3 thru 4 for the other burners in the zone.

6. Check the gas pressure at the inlet to the zone ratio regulator. This should be at least 5" w.c. (12.5 mbar) higher than the loading line pressure. It should not exceed the maximum pressure rating of the ratio regulator.

⚠ WARNING

- **Insufficient gas inlet pressure may cause the proportionator to remain fully open as the burner system turns down from high fire, causing excess fuel operation and possible accumulation of unburned fuel in the chamber. In extreme cases, this may cause explosions or fires.**

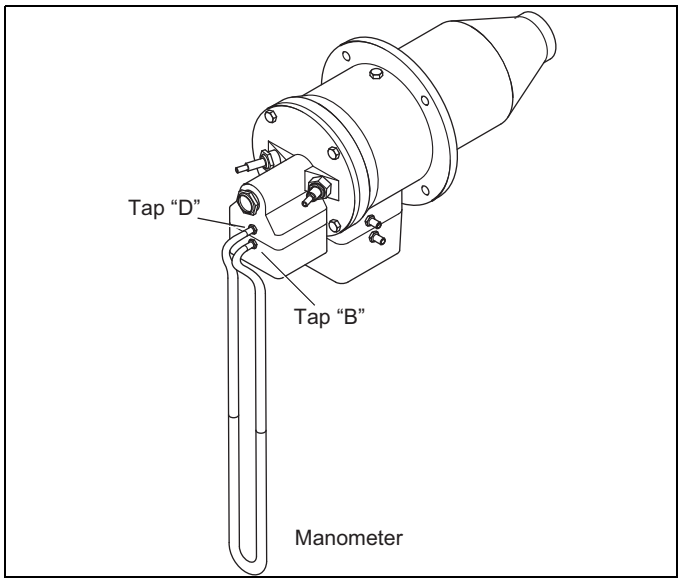

Figure 4.3. Set High Fire Gas

Step 7: Set Low Fire Gas

1. Drive the system to low fire.

2. Use the gas curve from the appropriate ThermJet datasheet for the gas being used to determine the differential gas pressure required for low fire. This is your target value for low fire.

3. Measure the gas pressure at the first burner.

4. Adjust the ratio regulator until the gas flow is on the target value. (Refer to Bulletin 742 for adjustment.)

NOTE: It is very difficult to measure the very low pressures experienced at low fire, and it may be necessary to rely on visual inspection. This is especially true when gas turndowns in excess of 10:1 are being used. The main intent is to provide a clean stable flame with a good flame signal that will not cause the furnace temperature to overshoot.

If the pressure required is too low to be measured, adjust the ratio regulator until a gas flow is obtained that will provide a clean stable flame with a strong flame signal.

Step 8: Verify the Gas Settings

Make sure that all settings are still the same after cycling the system several times between high and low fire.

NOTE: When all the settings have been completed, mark the position of the indicator on the butterfly valves to indicate valve position.

Fixed Air System

When you adjust a fixed-air system for the first time, you must follow these steps:

Step 1: Reset the System

1. Close the automatic gas valves and gas cocks.

2. Fully open the manual air butterfly valve at each burner.
   a. Drive the automatic zone air control valve to high fire.
   b. Adjust the automatic zone air control valve so that it is fully open.

3. Set the manual gas butterfly valve at each burner to 50% open.

4. Start the blower.

NOTE: Make sure that the blower rotates in the correct direction. If incorrect, have a qualified electrician rewire the blower to reverse its rotation.

Step 2: Set High Fire Air (Figure 4.1)

1. Set the system to high fire, but **DO NOT** ignite the burner(s).

2. Use the air curves in “Orifice Curves” from the appropriate ThermJet datasheet to find the differential air pressure needed at high fire. This is now the target value for high fire.

3. Set high fire air using the instructions for either a single burner system or multiple burner system below.

NOTE: A pressure tap is open when the screw inside the tap is unscrewed approximately half a turn.

Single Burner System:

a. Make sure that pressure taps A and C of the burner are open.

b. Connect the manometer to taps A and C (across the air orifice).

c. Adjust the manual butterfly valve until the high fire differential air pressure is at the target value.

d. Remove the manometer.

e. Close the pressure taps.

Multiple Burner System:

a. Make sure that pressure taps A and C of the first burner are open.

b. Connect the manometer to taps A and C of the first burner (across the air orifice).

c. Adjust the manual butterfly valve for the zone, until the high-fire differential air pressure is at the target value for the first burner.

d. Measure the differential air pressure across the next burner in the zone.

e. Repeat step **d** for all the burners in the zone.

f. If all the measured differential pressures are within 0.3" w.c (0.75 mbar) of each other, then proceed to the next section. If the variation is greater than 0.3" w.c. (0.75 mbar) it is necessary to adjust the manual air butterfly valve at each burner to improve the balance.

g. Make sure that all the pressure taps are closed.

4. Repeat 3 for other zones (if any).

Step 3: Ignite the Burners

⚠ WARNING

- **This procedure assumes that a flame monitoring control system is installed and is serviceable. It also assumes that normal low fire start is being used. If low fire gas is too low to be used for ignition, refer to options in "Set the Bypass Pilot Gas (Optional)" on page 16.**

1. Drive the zone gas automatic butterfly valve to low fire.

2. Make sure the combustion air blower is running.

3. Set the burner manual gas butterfly valve to low fire.

4. Set the adjusting screw on the ratio regulator six full (360°) turns down from the top (initial setting).

5. Select the valve according to the control method:

   a. **With high/low control:**
   Set the gas bypass butterfly valve 25% open.

   b. **With modulating gas control:**
   Set the zone gas automatic butterfly value to approximately 10% open. Stroke the valve to the open position to ensure 100% open. Readjust if necessary.

6. Open the zone gas manual gas cock.

7. Open the manual gas cock at each burner.

8. Initiate the ignition sequence through the flame monitoring control system.

9. Check that all the burners in the zone have ignited.

10. If shut-off solenoid valves are installed at each burner, then repeat 6 and 7 for all the burners in the zone.

11. If all the burners have ignited, drive the zone to high fire. Verify flame is present at each burner.

Step 4: Set High Fire Gas (Figure 4.1)

1. Use the gas curves from the appropriate ThermJet datasheet for the gas being used to find the differential gas pressure needed at high fire. This is the target value for high fire.

2. Connect the manometer to taps B and D (across the gas orifice, see Figure 4.3).

3. Measure the high fire differential gas pressure for the first burner.

4. Adjust the gas butterfly valve at the burner until the gas flow is at the target value.

5. Repeat 3 and 4 for the other burners in the zone.

6. Check the gas pressure at the inlet to the zone ratio regulator. This should be at least 5" w.c. (12.5 mbar) higher than the loading line pressure. It should not exceed the maximum pressure rating of the ratio regulator (optional).

⚠ WARNING

- **Insufficient gas inlet pressure may cause the proportionator to remain fully open as the burner**

system turns down from high fire, causing excess fuel operation and possible accumulation of unburned fuel in the chamber. In extreme cases, this may cause explosions or fires.

Step 5: Set Low Fire Gas

1. Drive the system to low fire.
2. Measure the gas pressure drop at the first burner.
3. Select the valve according to the control method:

   a. **With high/low control:**
   Adjust the gas bypass butterfly valve (see ThermJet Design Guide No. 205) until the minimum fire that will still maintain a strong flame signal is obtained.

   b. **With modulating gas control:**
   Adjust the zone gas automatic butterfly valve (see ThermJet Design Guide No. 205) until the minimum fire that will still maintain a strong flame signal is obtained.

NOTE: It is very difficult to measure the very low pressures experienced at low fire, and it may be necessary to rely on visual inspection. This is especially true when gas turndowns in excess of 10:1 are being used. The main intent is to provide a clean stable flame with a good flame signal that will not cause the furnace temperature to overshoot.

Step 6: Verify the Gas Settings

Make sure that all the settings are still the same after you have cycled the system several times between high and low fire.

NOTE: When all the settings have been completed, mark the position of the indicator on the butterfly valves to indicate valve position.

Set the Bypass Pilot Gas (Optional)

1. Set the system to low fire.
2. Make sure that the blower is on.

⚠ WARNING

- **Before you perform this procedure, make sure the flame monitoring control system is working.**

3. Use the flame monitoring control system to start the ignition and the bypass pilot gas for all the burners in the zone.
4. Adjust the manual butterfly valve in the bypass line until you obtain reliable ignition within the required trial for ignition time limit.
5. Repeat 4 for all the other burners and zones (if any).

Start Procedure

1. Start the blower.
2. Open all the gas cocks.
3. Start the ignition sequence.
4. Verify that flame is present at each burner.

⚠ DANGER

- **If a burner does not light, and the system does not shut down automatically, then you must close the main gas cock. An uncontrolled flow of gas can cause fires and explosions.**
- **Do not touch the ignition plug or the ignition wire when the ignition is on. You will get a shock.**

Stop Procedure

1. Close the following valves:
   - The manual gas cock for each burner or zone
   - The manual gas cock at the main control valve
   - All the manual shut-off valves in the gas line upstream of the burner gas cock
2. Let the burners cool down. Keep the blower on until the chamber temperature is less than 1000°F (500°C) and then stop the blower.

NOTICE

- **Keeping the blower on after the burner is off protects the burner and the other components from hot gases that flow back through the burner.**

Maintenance & Troubleshooting

5

This chapter is divided into two sections:

- Maintenance procedures
- Troubleshooting guide

Maintenance

Preventive maintenance is the key to a reliable, safe and efficient system. The core of any preventive maintenance system is a list of periodic tasks.

The following are suggestions for a monthly list and a yearly list.

NOTE: The monthly list and yearly lists are an average interval. If your environment is dirty, the intervals may be shorter.

Monthly Checklist

1. Test (leak test) safety shut-off valves for tightness of closure.
2. Test air pressure switch settings by checking switch movements against pressure settings and comparing with actual impulse pressure.
3. Visually check ignition cable and connectors.
4. Inspect impulse piping for leaks.
5. Clean and inspect all the burners.
6. Make sure that the following components are not damaged or distorted:
   - burner nozzle
   - spark plugs
   - flame sensors
   - flame tube or combustion block
7. If applicable, remove and clean all the orifice plates.

Yearly Checklist

1. Inspect flame-sensing devices for good condition and cleanliness.
2. Check for proper inlet air/gas ratios.
3. Test all the alarm systems for proper signals.
4. Check ignition spark plugs and proper gap.
5. Check valve motors and control valves for free, smooth action and adjustment.
6. Check for proper operation of the ventilating equipment.
7. Test the interlock sequence of all safety equipment; manually make each interlock fail, noting that related equipment closes or stops as specified by the manufacturer.
8. Test flame monitoring control system by manually shutting off gas to burner.
9. Test main fuel hand-valves for operation.
10. Clean or replace the combustion air blower filter.

Troubleshooting Procedures

Problem	Possible Cause	Solution
Cannot initiate start sequence	Air pressure switch has not made contact	Check air pressure switch adjustment. Check air filter. Check blower rotation. Check outlet pressure from blower.
	High gas pressure switch has tripped	Check incoming gas pressure. Adjust gas pressure if necessary. Check pressure switch setting and operation.
	Low gas pressure switch has tripped	Check incoming gas pressure. Adjust gas pressure if necessary. Check pressure switch setting and operation.
	Malfunction of flame monitoring control system such as shorted out flame sense or electrical noise in the sensor line	Have a qualified electrician investigate and rectify.
	Purge cycle not completed	Check flame monitoring control system or purge timer.
	Main power is off	Make sure power is on to control system.
	No power to control unit	Call qualified electrician to investigate.
Start-up sequence runs but burner does not light	No ignition: There is no power to the ignition transformer	Restore power to the ignition transformer.
	No ignition: Open circuit between the ignition transformer and the spark plug	Repair or replace the wiring to the spark plug.
	No ignition: The spark plug needs cleaning	Clean the spark plug.
	No ignition: The spark plug is not correctly grounded to the burner	Clean the threads of the spark plug and the burner. Do not apply grease to the thread of the spark plug.
	Too much gas: Improper gas valve train sequence	Verify solenoid valve is down-stream of proportionator.
	Too much gas: Manual gas butterfly valves have been opened too far	Check pressures and settings against start-up report and adjust as necessary.
	Too much gas: Gas pressure out of the main gas pressure regulator is too high	Check start-up setting. If necessary, remove regulator and investigate.
	Not enough gas: The gas pressure out of the main gas pressure regulator is too low	Check start-up setting. Check regulator and adjust if necessary.
	Not enough gas: Start gas solenoid valve does not open.	Check solenoid valve coil for proper orientation. Replace if necessary.
	Not enough gas: Gas valve not open	Check wiring to the automatic gas shut-off valve.
	Not enough gas: Air in the gas line	Check output from the flame safeguard. Open gas cock. Purge gas line.

Problem	Possible Cause	Solution
The low fire flame is weak or unstable	Low fire adjusted too slow	Increase low fire gas setting.
	Not enough gas	Check start-up settings and adjust to increase low gas flow.
	Not enough air	Check start-up settings. Investigate any change, i.e. blocked filter, loose connections.
The burner goes off when it cycles to high fire	Insufficient air (flame too rich)	Check start-up settings. Check air filter, clean or replace if required.
The burner is erratic and does not respond to adjustment	Flame signal weak	Check condition of flame monitoring device.
	Internal damage to the burner. Some parts inside the burner may be loose or dirty.	Contact Eclipse.
The burner is unstable or produces soot or smoke	The air/gas ratio is out of adjustment	Measure all gas pressures and air pressures. Compare to initial start-up settings, and adjust them where necessary.
Cannot achieve full capacity	Air filter is blocked	Clean or replace the air filter.
	Gas pressure is too low into the main gas pressure regulator	Adjust gas pressure.
	Increase furnace/chamber pressures	Re-check setup pressures.
	Poor piping practices	Contact Eclipse.

Type HSR Pressure Reducing Regulator for Residential, Commercial, or Industrial Applications

Figure 1. Type HSR Pressure Regulator

Introduction

Scope of Manual

This manual provides instructions for the installation, adjustment, maintenance, and parts ordering for the Type HSR residential and/or industrial/commercial pressure regulator.

Description

The Type HSR direct-operated, spring-loaded regulators provide economical pressure reducing control in a variety of residential, commercial, and industrial applications. These regulators can be used with natural, manufactured, or liquefied petroleum gases. In addition, the Type HSR regulator has internal relief across the diaphragm to help minimize overpressure. Any outlet pressure above the start-to-discharge point of the nonadjustable relief valve spring moves the diaphragm off the relief valve seat, allowing excess pressure to bleed out through the screened spring case vent.

Specifications

Specifications for the Type HSR constructions are given on page 2. The following information is located on the spring case: type number, orifice size, spring range, and date of manufacture.

D103074X012

Specifications

Available Configurations

Type HSR: Service regulator with internal relief; this regulator meets ANSI B109.4 / CGA 6.18

Body Sizes (Inlet x Outlet) and End Connection Styles

3/4 x 3/4-inch (DN 20 x 20), 3/4 x 1-inch (DN 20 x 25), and 1 x 1-inch (DN 25 x 25) NPT
All sizes available in Globe or Angle body.

Allowable Inlet Pressures(1)

Emergency: 150 psig (10,3 bar)
Maximum Operating Pressure: See table 1

Allowable Outlet Pressures(1)

Emergency (Casing): 25 psig (1,7 bar)
Maximum Operating Pressure to Avoid Internal Parts Damage: 3 psi (0,21 bar) differential above outlet pressure setting

Outlet Pressure Ranges

See table 2

Spring Case Vent Connection

Standard: 1-inch NPT with removable screen
Optional: 3/4-inch NPT with removable screen

Internal Relief Performance

Approximate Internal Relief Start-To-Discharge Point: 6 to 12-inches w.c. (15 to 30 mbar) above outlet pressure setting
Relief Performance: See figures 3 and 4

Lockup Performance During Normal Operation

ORIFICE SIZE, INCHES (mm)	LOCKUP ABOVE SETPOINT, INCHES W.C. (mbar)
1/8 (3,2)	1 (2,5)
3/16 (4,8)	1 (2,5)
1/4 (6,3)	2 (5,0)
3/8 (9,5)	2.5 (6,2)
1/2 (12,7)	3 (7,5)

Material Temperature Capabilities(2)

-20° to 160°F (-29° to 71°C)

Pressure Setting Adjustment

Adjusting Screw

Pressure Registration

Internal

Approximate Weight

4 pounds (1,8 kg)

1. End connections for other than U.S. standards can usually be provided, consult the Fisher Sales Office or Sales Representative.
2. The pressure/temperature limits in this instruction manual and any applicable standard or code limitation should not be exceeded.

Table 1. Maximum Operating Inlet Pressure

ORIFICE SIZE, INCH (mm)	WIDE-OPEN C_g FOR RELIEF SIZING	MAXIMUM OPERATING INLET PRESSURE TO OBTAIN GOOD REGULATING PERFORMANCE
1/8 (3,2)	12.5	125 (8,6)
3/16 (4,8)	28.2	100 (6,9)
1/4 (6,4)	50.0	60 (4,1)
3/8 (9,5)	105	30 (2,1)
1/2 (12,7)	185	20 (1,4)

Table 2. Outlet Pressure Ranges

OUTLET PRESSURE RANGE	SPRING PART NUMBER	SPRING COLOR	CLOSING CAP	SPRING WIRE DIAMETER, INCH (cm)	SPRING FREE LENGTH, INCH (cm)
6 to 8-inches w.c. (15 to 20 mbar)	T14399T0012	Yellow	Black	0.067 (0,17)	3.6 (9,1)
10 to 12.5-inches w.c. (25 to 31 mbar)	T14400T0012	Silver	Black	0.072 (0,18)	4.1 (10)
12.5 to 20-inches w.c. (31 to 50 mbar)	T14401T0012	Gray	Black	0.080 (0,20)	3.6 (9,1)
20 to 35-inches w.c. (50 to 87 mbar)	T14402T0012	Pink	Black	0.93 (0,24)	3.5 (8,9)

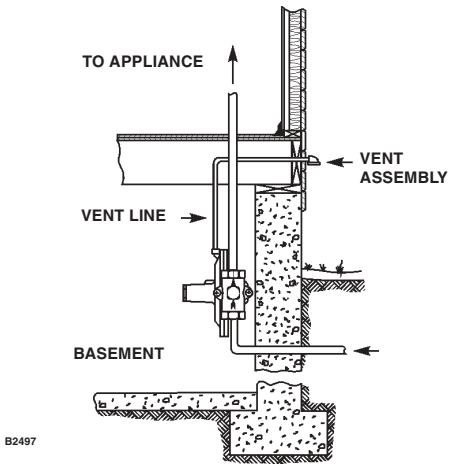

Figure 2. Typical Vent Line Installation

Installation

WARNING

Personal injury, equipment damage, or leakage due to escaping gas or bursting of pressure-containing parts might result if these regulators are overpressured or installed where service conditions could exceed the limits for which the regulators were designed, or where conditions exceed any ratings of the adjacent piping or piping connections. To avoid such injury or damage, provide pressure-relieving or pressure-limiting devices (as required by the appropriate code, regulation or standard) to prevent service conditions from exceeding those limits.

Additionally, physical damage to a regulator could cause personal injury and property damage due to escaping gas. To avoid such injury and damage, install the regulator in a safe location.

A regulator may vent some gas to the atmosphere in hazardous or flammable gas service, vented gas might accumulate and cause personal injury, death or property damage due to fire or explosion. Vent a regulator in hazardous gas service to a remote, safe location away from air intakes or any hazardous location. The vent line must be protected against condensation or clogging.

Before installing the regulator, check for damage which might have occurred in shipment. Also check for dirt or foreign matter which may have accumulated in the regulator body or in the pipeline. Apply pipe compound to the male threads of the pipeline and install the regulator so that the flow is in the direction of the arrow cast on the side of the body. The diaphragm actuator assembly can be rotated to any position relative to the body, in 90° increments. ***Remove the two cap screws (key 17) that hold the body to the actuator in order to rotate the diaphragm actuator assembly.***

Do not install the regulator in a location where there can be excessive water accumulation, such as directly beneath a downspout or in an undrained pit.

To obtain the maximum flow capacities or other performance characteristics, the length of pipe from the regulator outlet to the meter—or for the first 18 inches (457 mm), whichever is closer—should have no bends and should be the same size as the regulator outlet. Replace the regulator if water gets into the spring case or the lower casing of the regulator.

HSR Series regulators have a spring case vent (1-inch NPT female or 3/4-inch NPT female) which is screened to prevent insects or foreign material from entering.

CAUTION

You are advised to use new vent piping because defective threads on the relief vent piping may interfere with the venting assembly if the piping obstructs the movement of the vent flapper.

On indoor installations, the vent should be piped outside the building, see figure 2. Remove the screen from the regulator vent connection and connect vent piping from that connection to the outdoors. Vent piping should be as large in diameter as practical, be as short as possible, and have a minimum number of bends and elbows. Install a weather and insect resistant vent assembly on the outside end of the pipe, such as a Fisher Type Y602. The same installation precautions apply to vent assemblies as the integral regulator vents described previously.

A program of regular inspection of the vent opening should be established to see that it has not become plugged by foreign material. On some installations, such as in areas of heavy snowfall, it may be necessary to install the regulator beneath a protective hood. If other protection is provided from the elements, the vent should be pointing or sloping down sufficiently to allow any condensate to drain. Also check the regulator periodically for external or internal corrosion.

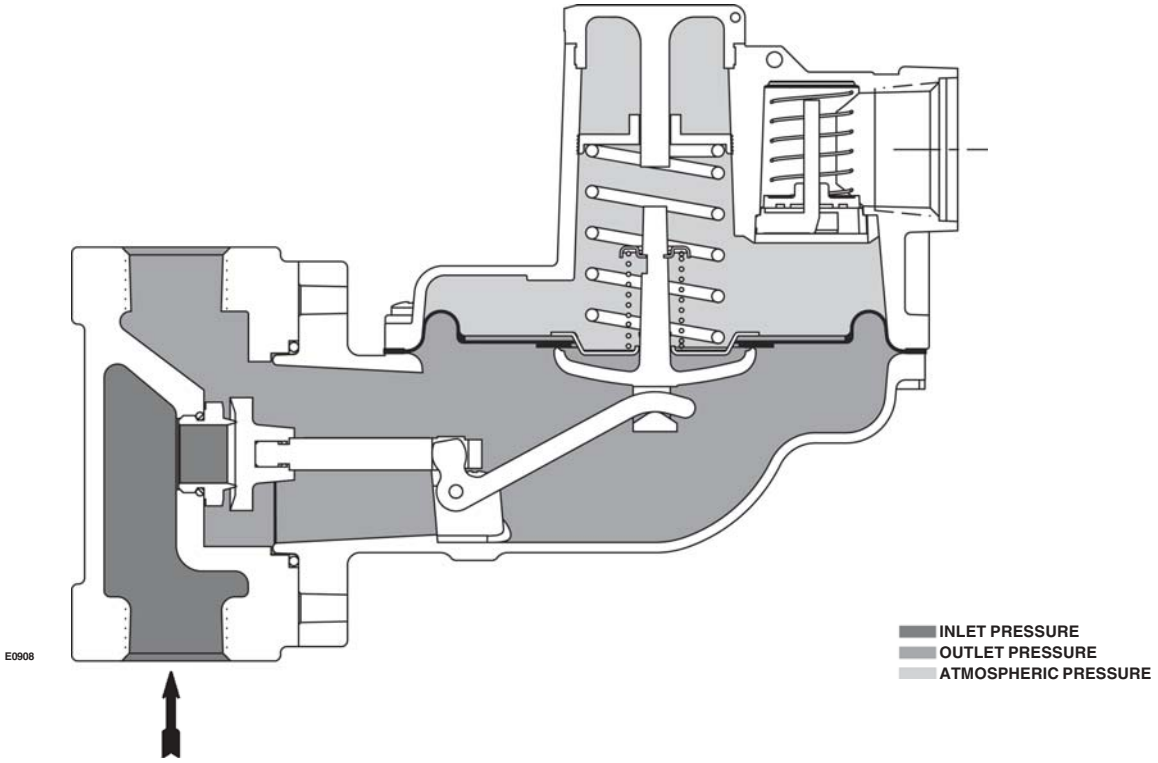

Figure 3. Type HSR Pressure Regulator Operational Schematic

Principle of Operation

Refer to figure 3. When downstream demand decreases, the pressure under the diaphragm increases. This pressure overcomes the regulator setting (which is set by a spring). Through the action of the pusher post assembly, the valve disk moves closer to the orifice and reduces gas flow. If demand downstream increases, pressure under the diaphragm decreases.

Spring force pushes the pusher post assembly downward and the valve disk moves away from the orifice.

The Type HSR regulators include an internal relief valve for overpressure protection. If the downstream pressure exceeds the regulator setting by 7-inches w.c. to 1.25 psig (17 to 86 mbar), depending on the main spring used, the relief valve opens and excess gas escapes through the vent in the upper spring case.

Overpressure Protection

WARNING

Some type of overpressure protection is needed if actual inlet pressure can exceed the outlet pressure rating. Overpressuring any portion of this equipment above the limits given in the Specification section and tables 1 and 2 may cause damage to regulator parts, leaks in the regulator, or personal injury due to bursting of pressure-containing parts or explosion of accumulated gas.

Table 3. Relief Performance

ORIFICE SIZE, INCH (mm)	MAXIMUM ALLOWABLE INLET PRESSURE IF OUTLET PRESSURE IS HELD AT OR BELOW 2 PSIG (140 mbar), PSIG (bar)
1/8 (3,2)	125 (3,6)
3/16 (4,8)	65 (4,5)
1/4 (6,4)	30 (2,1)
3/8 (9,5)	10 (0,69)
1/2 (12,7)	7 (0,48)

1. The relief performance testing is in accordance with ANSI B109.4 and CGA 6.18, with the regulator set at 7-inch (17 mbar), stem linkage disconneced, and vented directly to atmosphere using the 3/4 or 1-inch vent.

Type HSR regulators provide internal relief that limits the total outlet pressure buildup over setpoint. This internal relief may be adequate for the application, if not, provide additional pressure relief or a pressure-limiting device downstream. Regulators should be inspected for damage after any overpressure condition.

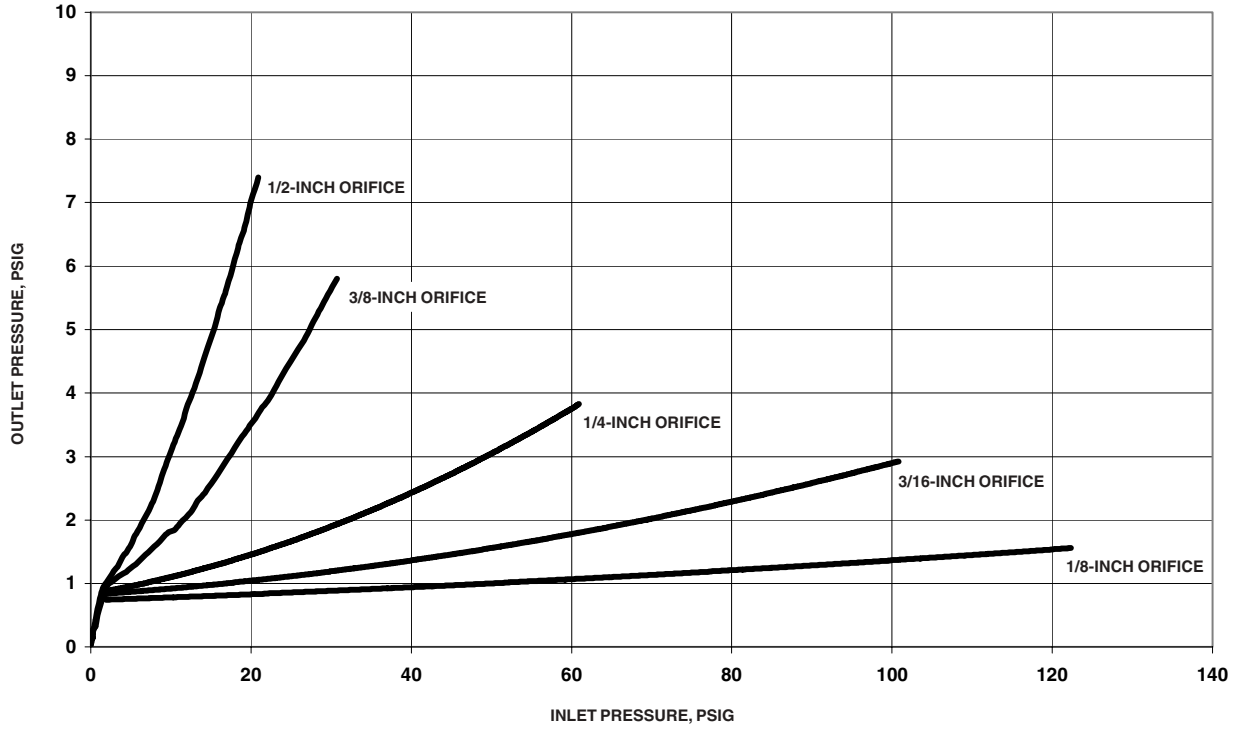

Figure 4. 7-inch w.c. Setpoint Relief Curves (with lever disconnected, no vent piping, and 3/4 or 1-inch vent)

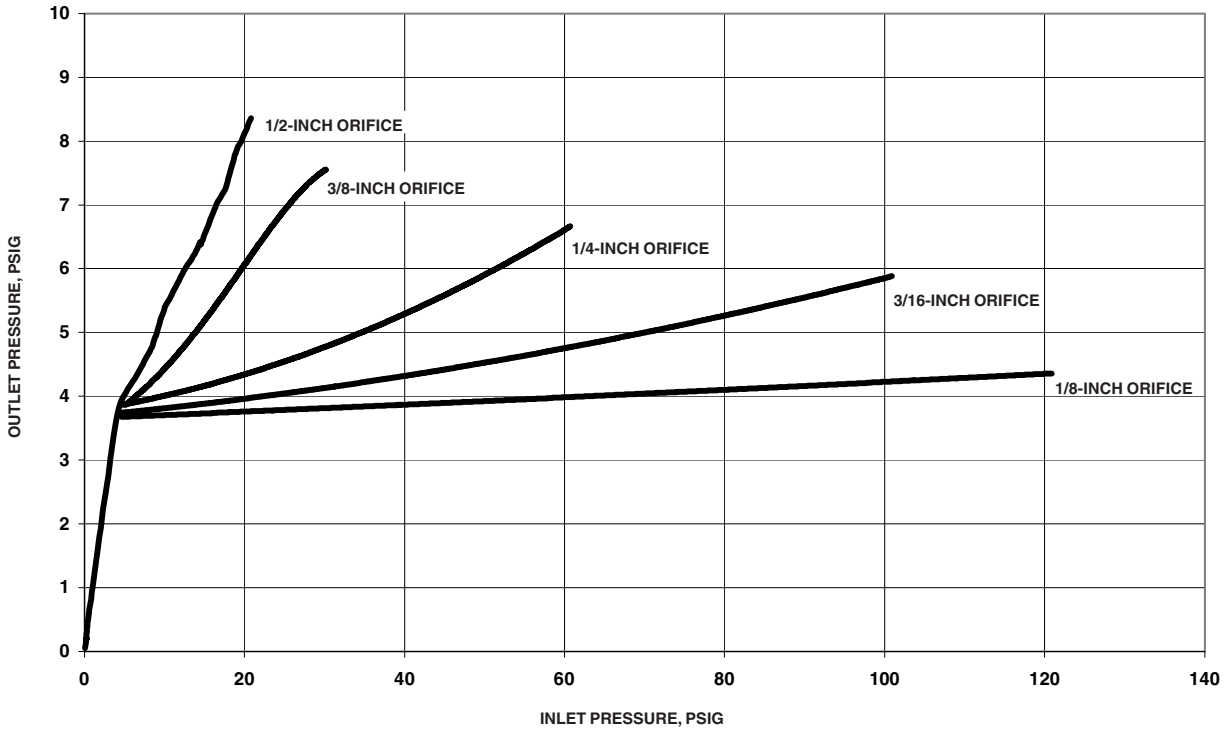

Figure 5. 2 psig Setpoint Relief Curves (with lever disconnected, no vent piping, and 3/4 or 1-inch vent)

WARNING

To avoid personal injury or property damage due to explosion or damage to regulator or downstream components during startup, release downstream pressure to prevent an overpressure condition on the diaphragm of the regulator.

In order to avoid an overpressure condition and possible equipment damage, pressure gauges should always be used to monitor pressures during startup.

Startup

1. Check to see that all appliances are turned off.
2. Slowly open the upstream shutoff valve.
3. Slowly open the downstream shutoff valve
4. Check all connections for leaks.
5. Make final control spring adjustments according to the adjustment procedures.
6. Light the appliance pilots.

Adjustment

To increase the outlet pressure setting of the regulator, the adjusting screw (key 26, figure 6) must be turned clockwise. This requires removal of the closing cap (key 8, figure 6). To reduce the outlet pressure setting, turn the adjusting screw counterclockwise. A pressure gauge should always be used to monitor downstream pressure while adjustments are being made. Do not adjust the spring to produce an outlet pressure setting above the limit identified on the information label. If the required pressure setting is not within the range of the spring being used, substitute with the correct spring, see table 2. When changing the spring, also change the range identified on the information label to indicate the actual pressure range of the spring in use. After the spring adjustment has been completed, replace the closing cap.

Shutdown

WARNING

To avoid personal injury or property damage due to explosion or damage to regulator or downstream components during shutdown, release downstream pressure to prevent an overpressure condition on the regulator diaphragm.

Installation arrangements may vary, but in any installation it is important that the valves be opened or closed slowly. These steps apply to the typical installation.

1. Slowly close the downstream shutoff valve.
2. Slowly close the upstream shutoff valve.
3. Open vent valves downstream of the regulator.
4. Open vent valves upstream of the regulator.

Maintenance

WARNING

Avoid personal injury or damage to property from sudden release of pressure or uncontrolled gas or other process fluid. Before starting to disassemble, isolate the regulator from all pressure and cautiously release trapped pressure from the regulator. Use gauges to monitor inlet, loading and outlet pressures while releasing these pressures.

These procedures are for gaining access to the diaphragm, valve disk and orifice. All pressure must be released from the diaphragm actuator assembly before the following steps can be performed.

While using the following procedures, refer to figure 6 for key number locations.

Diaphragm Replacement

1. Remove the closing cap (key 8) and adjusting screw (key 26).
2. Remove the spring case machine screws (key 9) out of the spring case (key 1), and remove the spring case and control spring (key 25).
3. Lift the diaphragm slightly, and slide it away from the lever (key 4), so that the pusher post (key 12) releases the lever.
4. Remove the spring retainer (key 14). Note the direction of the spring retainer assembly to aid in proper reassembly. Remove the relief spring (key 10).
5. Remove the diaphragm (key 11). Examine the diaphragm and replace if necessary.

6. Reassemble in the reverse order of the above procedures. Before attaching the spring retainer (key 14) to the pusher post (key 12) to secure the new diaphragm, place the loosely assembled diaphragm into position in the lower casing (key 2), being sure the pusher post is properly hooked on the lever (key 4). Rotate the diaphragm so that the diaphragm and lower casing holes align. Check the diaphragm for proper orientation. The open slot in the spring retainer is inserted from the notched side of the pusher post. Install the spring retainer (key 14) and proceed with reassembly. Tighten the spring case cap screws (key 9) to 15 to 30 inch-pounds (1,7 to 3,9 N•m).

Valve Disk and Orifice Replacement

1. Remove the cap screws (key 17) which hold the actuator assembly to the body.

2. The regulator can be removed from the body, exposing the disk (key 23) and the orifice (key 22).

3. Examine the disk. If it is nicked, cut, or otherwise damaged, the disk (key 23) should be removed from the valve stem (key 5) and replaced with a new part.

4. Examine the seating edge of the orifice (key 22). If it is nicked or rough, it should be unscrewed from the body with a thin wall 7/8-inch socket wrench and replaced with a new orifice to provide proper shutoff. Treat the male threads of the new orifice with lubricant before reassembling, tightening to 35 to 45 foot-pounds (48 to 61 N•m) of torque.

5. Reassemble in the reverse order of the above procedures. Tighten the cap screws (key 16) to 6 to 10 foot-pounds (8,1 to 13,6 N•m).

Parts Ordering

The type number, orifice size, spring range, and date of manufacture are located on the spring case. Always provide this information in any correspondence with your Fisher Sales Representative regarding replacement parts or technical assistance. If construction changes are made in the field, be sure that the information label is also changed to reflect the most recent construction.

Part List

Key	Description	Part Number

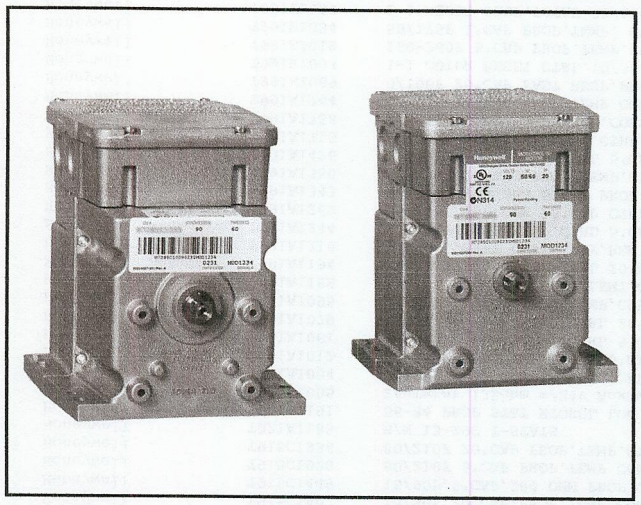
Honeywell

Series 71, 72, and 76 Modutrol IV™ Motors

PRODUCT DATA



APPLICATION

The Series 71, 72 and 76 Modutrol IV Motors are spring return and non-spring return motors used to control dampers and valves. The motors accept a current or voltage signal from an electronic controller to position a damper or valve at any point between open and closed.

EPRI Edgemont Precision Rebuilders, Inc
Matlack Industrial Center
207 Carter Dr Ste C
West Chester, PA 19382
800-356-3774

FEATURES

- **Replaces M734H,J,; M744S,T,Y; and M745L,S,T,Y Motors.**
- **M7164, M7261, M7284, and M7294 are non-spring return motors; M7282, M7285, M7286 and M7685 are spring return motors.**
- **Integral spring return returns motor to normal position when power is interrupted.**
- **Integral junction box provides NEMA 3 weather protection.**
- **Motor and circuitry operate from 24 Vac. Models available with factory installed transformer, or a field added internal transformer.**
- **Quick-connect terminals are standard—screw terminal adapter is available.**
- **Adapter bracket for matching shaft height of older motors is available.**
- **Most motors have field adjustable stroke (90° to 160°).**
- **Die-cast aluminum housing.**
- **Integral auxiliary switches are available factory mounted, or can be field added.**
- **Nominal timing standard of 30 seconds (90° stroke), and 60 seconds (160° stroke). Other timings available.**
- **Spring return motors can operate valve linkages from power end or auxiliary end shafts for normally closed or normally open valve applications.**
- **All models have dual shafts (slotted and tapped on both ends).**
- **All models have auxiliary switch cams.**
- **Fixed torque throughout the entire voltage range.**
- **Motors are designed for either normally open or normally closed valves and dampers.**
- **Models available with adjustable start (zero) and span.**
- **Models available with 4 to 20 mA input signal.**
- **Models available with 2 to 10 Vdc input signal.**

SPECIFICATIONS

Models: TRADELINE models are selected and packaged to provide ease of stocking, ease of handling and maximum replacement value. TRADELINE model specifications are the same as those of standard models unless specified otherwise.

IMPORTANT

The specifications given in this publication do not include normal manufacturing tolerances. Therefore, an individual unit may not exactly match the listed specifications. Also, this product is tested and calibrated under closely controlled conditions and some minor differences in performance can be expected if those conditions are changed.

Modutrol IV Order Number Guide: See Table 4.

Dimensions: See Fig. 2.

Controller: These motors can be used with any electronic controller that provides a stable noise-free proportional current output as specified in Electrical Ratings, Input Range below.

Electrical Ratings:
Power Consumption: See Table 1.
Input Range:
- Current, Nonadjustable: 4 to 20 mA nominal, 25 mA maximum.
- Current, Adjustable: 4 to 20 mA adjustable, 50 mA maximum.
- Zero/Null (Motor Closed): 0.0 to 18 mA.
- Span: 1.8 to 20 mA.
- Voltage, Nonadjustable: 2 to 10 Vdc.

Input Impedance:
- 4 to 20 mA Input: 100 ohms.
- 2 to 10 Vdc Input: 400K ohms.

Auxiliary Switch Ratings (in Amps): See Table 2.

Stroke: Most models available with field adjustable strokes from 90° to 160°. Stroke adjusted by means of potentiometers located in the wiring compartment.

Timing: Nominal 30 seconds for 90° stroke and 60 seconds for 160° stroke.

Dead Weight Load On Shaft: 200 lb (91 kg) on motor power or auxiliary end; maximum combined load of 300 lb (136 kg).

Ambient Temperature Ratings: -40 to 150°F (-40 to 66°C).

Shaft: 3/8 in. (9.5 mm) square.

Motor Rotation:
Closed: Counterclockwise rotation limit as viewed from motor power end.
Mechanically Normally Closed: Spring return. Normally closed motors rotate to closed position on power loss.
Electrically Normally Closed: Both spring return and non-spring motors return to closed position on minimum signal.

Table 1. Series 72 Modutrol IV Motor Power Consumption Ratings (at 120 Vac, 50/60 Hz).

Model	Power Consumption	
	VA	Watts
M7261	15	13
M7282	20	18
M7284	15	13
M7285	20	18
M7286	20	18
M7294	15	13

Table 2. Auxiliary Switch Ratings (in Amps).

One Contact Rating[a]	120V	240V
Full Load	7.2	3.6
Locked Rotor	43.2	21.6

[a] 40 VA pilot duty, 120/240 Vac on opposite contact.

Approvals:
Underwriters Laboratories Inc. Listed: File No. E4436; Guide No. XAPX for USA and Canada.
U.S. Patents: pending

Table 3. Primary 50017460-001 Color Code

Lead Color	Primary Voltage
Brown	24 VAC

Accessories:
220736A Internal Auxiliary Switch Kit; one switch. Can be field-installed.
220736B Internal Auxiliary Switch Kit; two switches, can be field-installed on TRADELINE models.
220738A Adapter Bracket raises motor shaft height by 3/4 in (19 mm) to match that of previous Modutrol Motor models.
220741A Screw Terminal Adapter converts the standard quick-connect terminals to screw terminals.
221455A Infinitely Adjustable Crank Arm, can rotate through downward position and clear motor base without requiring an adapter bracket.
4074ERU Weatherproofing Kit provides NEMA 3 rating for Modutrol IV Motors mounted in position other than upright.
50017460-001 Internal Transformer; 24/120/230 Vac 50/60 Hz primary, 24 Vac secondary, quick connect terminals.
50017460-003 Internal Transformer; 120 Vac 50/60 Hz primary, 24 Vac secondary, quick connect terminals.
7617ADW Crank Arm, can rotate through downward position and clear motor base without requiring an adapter bracket.
Q100 Linkage connects Modutrol Motor to V51 Butterfly Valve. Requires the 220738A Adapter Bracket.
Q181 Auxiliary Potentiometer for sequence or unison control of 1 to 4 additional modulating (Series 90) motors.
Q209E,F Manual Potentiometer for Modutrol Motors
Q5001 Bracket and Linkage Assembly connects Modutrol IV Motor to water or steam valve.
Q605 Damper Linkage connects motor to damper. Includes motor crank arm.
Q607 External Auxiliary Switch controls auxiliary equipment as a function of motor position.
ES650-117 Explosion-Proof Housing encloses motor for use in explosive atmospheres. Not for use with Q5001 (or any other valve linkages).
Order separately from EGS Enclosures in Houston, TX.
To order contact
Karen Barfield
Phone: (281) 774-3763
Email: Karen.barfield@egseg.com
http://www.appletonelec.com
Part number ES-650-117
You need to order a 7617DM coupling assembly from Honeywell to use with the cover.

INSTALLATION

When Installing this Product...

1. Read these instructions carefully. Failure to follow them could damage the product or cause a hazardous condition.
2. Check the ratings given in the instructions and on the product to make sure the product is suitable for your application.
3. Installer must be a trained, experienced service technician.
4. After installation is complete, check out product operation as provided in these instructions.

⚠ CAUTION

Electrical Shock or Equipment Damage Hazard.
Can shock individuals or short equipment circuitry.
Disconnect all power supplies before installation. Motors with auxiliary switches can have more than one disconnect.

⚠ CAUTION

Equipment Damage Hazard.
Can damage the motor beyond repair.
Never turn the motor shaft by hand or with a wrench. Forcibly turning the motor shaft damages the gear train and stroke limit contacts.

IMPORTANT

Always conduct a thorough checkout when installation is complete.

Location

Allow enough clearance for accessory installation and motor servicing when selecting a location (see Fig. 2). If located outdoors, use liquid-tight conduit connectors with the junction box to provide NEMA 3 weather protection. If mounted outdoors in a position other than upright, install a 4074ERU Weatherproofing Kit and liquid-tight connectors to provide NEMA 3 protection.

⚠ CAUTION

Motor Damage Hazard.
Deteriorating vapors and acid fumes can damage metal parts.
Install motor in areas free of acid fumes and other deteriorating vapors.

In excessive salt environments, mounting base and screws should be zinc or cadmium plated, not stainless steel or brass. Use the 220738A Adapter Bracket for mounting on these surfaces.

Mounting

Use the following guidelines for proper motor mounting:
- Always install motors with the crankshaft horizontal.
- Mounting flanges extending from motor housing base are drilled for 1/4 inch (6.4 mm) machine screws or bolts.
- Non-Spring Return Motors are shipped from the factory in the closed position (at the counterclockwise rotation limit, as viewed from the motor power end).
- Spring Return Motors are shipped from the factory in their normal position.
- Normally closed models are shipped at the counterclockwise rotation limit, as viewed from the motor power end.

Adapter Bracket

The 220738A Adapter Bracket, positioned between the motor and the equipment, raises motor shaft height by 0.75 in. (19 mm) to match that of previous Modutrol Motor models.

The following applications require this bracket:
- Q607 External Auxiliary Switch.
- Damper linkage applications requiring added clearance to allow:
  - — Crank arm rotation through the downward position.
  - — Sufficient damper linkage to reach the motor shaft.
- All valve linkages except the Q5001.

NOTE: When the bracket is not used in a replacement application, the damper linkage requires adjustment for the new shaft position.

EPRI Edgemont Precision Rebuilders, Inc
Matlack Industrial Center
207 Carter Dr Ste C
West Chester, PA 19382
800-356-3774

To mount the motor with the bracket:

1. Mount the bracket to the equipment with existing or standard bolts.
2. Using the provided bolts, mount the motor to the bracket threaded holes. See Fig. 3.

For valve linkage applications (other than the Q5001):

1. Mount the bracket to the linkage.
2. Position the motor on the bracket to align the motor shaft with the linkage.
3. Attach the motor to the bracket with the four bolts provided. See Fig. 4.

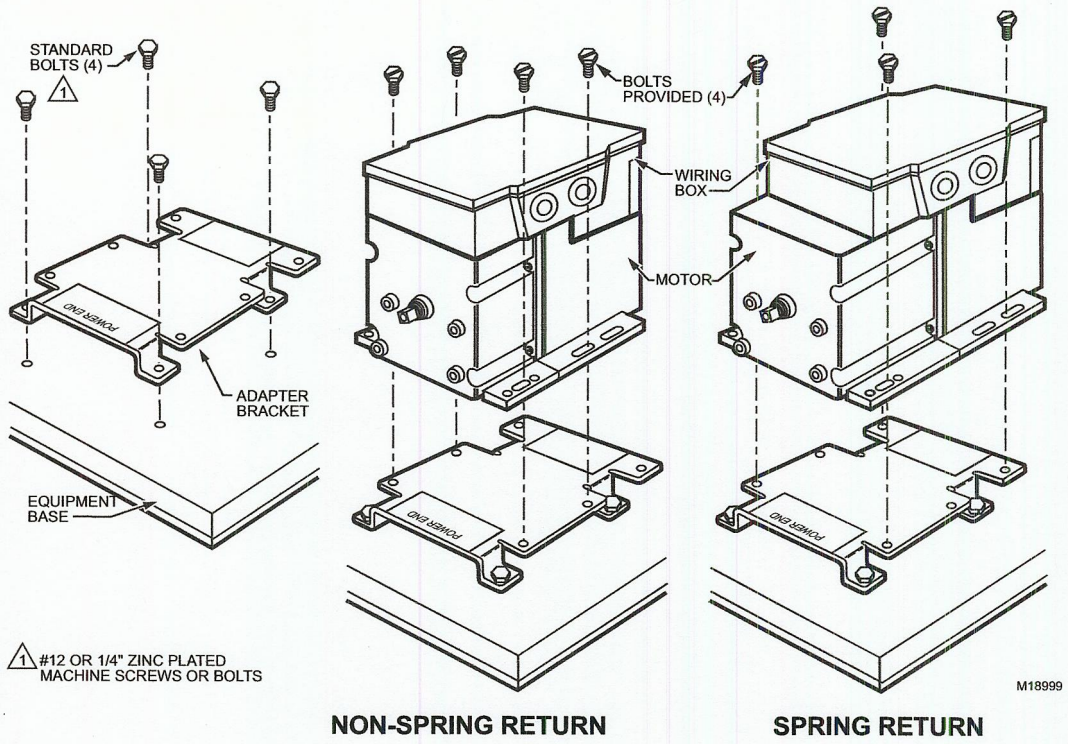

Fig. 3. Mounting the motor with an adapter bracket.

Damper Linkages

The motor does not include a crank arm. Order the crank arm separately (see Accessories in the Specifications section). For detailed instructions on the assembly of specific linkages, refer to the Installation Instructions packed with the linkage.

⚠ CAUTION

Equipment Damage Hazard.
Stalling a motor can damage the drive shaft.
Ensure installation of motors and linkages allows the motor to drive through full stroke without obstruction.

Valve Linkages

The Q100 Linkage requires a 220738A Adapter Bracket for all valve applications. Applications with the Q5001 Valve Linkage do not require the 220738A Adapter Bracket (see Fig. 4).

For detailed instructions on specific linkage assemblies, refer to the instruction sheet packed with the linkage. In general, check the following points when installing a motor and linkage:

- Adjust valve and louver-type damper linkages so the damper or valve moves through only the maximum required distance while the motor moves through its full stroke.
- With modulating control, maximum damper opening should be no more than 60 degrees. Little additional airflow is provided beyond this point.
- Do not exceed load and torque ratings in any application.

Junction Box

When used with liquid-tight conduit connectors, the junction box provides NEMA 3 weather protection for the motor. The junction box, standard with replacement motors, encloses the terminals and provides knockouts for wiring conduits. Housing an internal transformer or internal auxiliary switches requires using a junction box.

EPRI Edgemont Precision Rebuilders, Inc
Matlack Industrial Center
207 Carter Dr Ste C
West Chester, PA 19382
800-356-3774

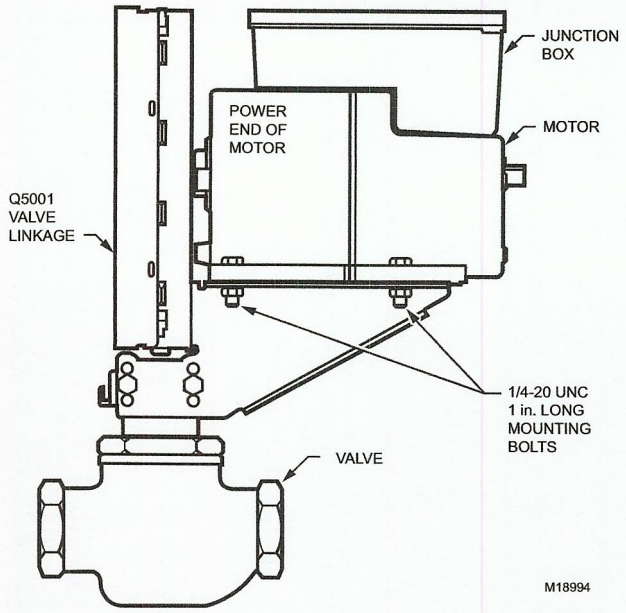

Fig. 4. Mounting the motor on a Q5001 Valve Linkage.

Wiring

⚠ CAUTION

Electrical Shock or Equipment Damage Hazard.
Can shock individuals or short equipment circuitry.
Disconnect all power supplies before installation.
Motors with auxiliary switches can have more than one disconnect.

IMPORTANT

All wiring must agree with applicable codes, ordinances and regulations.

1. Ensure that the voltage and frequency stamped on the motor correspond with the power supply characteristics.
2. When connecting several motors in parallel, ensure that the power supply VA rating is large enough to provide power to all motors used without overloading.
3. Fig. 10 shows that motor terminals are quick-connects located on top of the printed circuit board.
4. To access the wiring compartment:
   a. Remove the four screws from the junction box top.
   b. Lift off the cover.
5. Refer to Fig. 5 through 8 for wiring.

Wire the motor as follows:

1. Remove the wiring box cover by removing the four screws holding the cover to the motor.
2. Wire motor to system using quick-connect terminals in wiring box.
3. Replace wiring box cover.

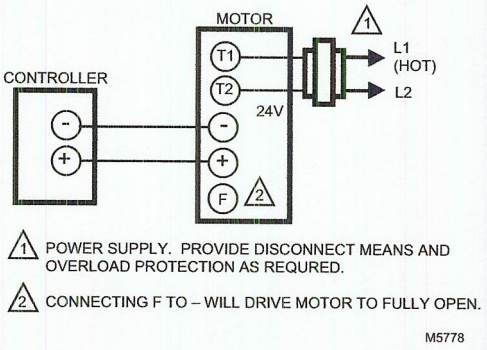

Fig. 5. Typical system wiring.

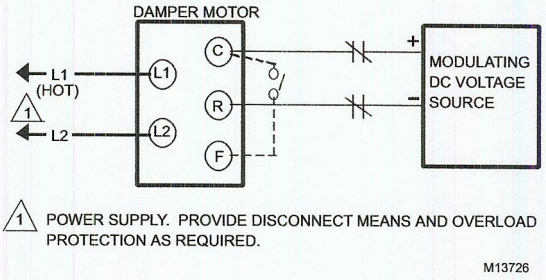

Fig. 6. Series 71 optional override switches to drive motor open or closed.

West Chester, PA 19382
800-356-3774

SETTINGS AND ADJUSTMENTS

Before Setting Stroke

1. Remove the top cover from the motor.
2. Disconnect the controller from the motor.
3. For models with an internal transformer (line voltage motors), ensure that power (and nothing else) remains connected to the motor.

IMPORTANT

Detach linkage from motor before adjusting stroke.

⚠ CAUTION

Careless Installation Hazard.
Use of excessive force while adjusting cams damages the motor.
To avoid damaging motor end switches, set cams by moving only the screwdriver top.

⚠ CAUTION

Equipment Damage Hazard.
Can damage the motor beyond repair.
Never turn the motor shaft by hand or with a wrench. Forcibly turning the motor shaft damages the gear train and stroke limit contacts.

Adjustable Stroke

All models except for M7284C1083, M7284C1091, M7284Q1082, and M7284Q1090.

When viewing from the power end of the motor, the stroke potentiometer is to the far left. To set the stroke to 160° (maximum position) turn the potentiometer fully clockwise ↷, using a 1/8 in. straight-blade screwdriver. To set the stroke at 90° (minimum position) turn the potentiometer fully counter-clockwise ↶. Setting the potentiometer anywhere between fully clockwise and fully counter-clockwise will set the stroke between 160° and 90°.

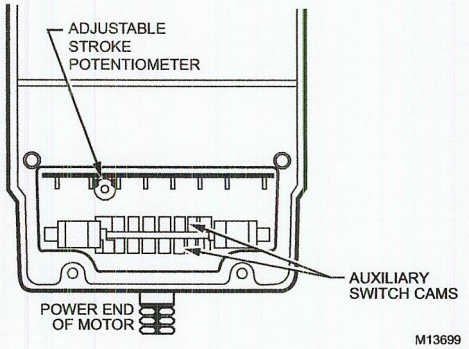

Fig. 9. Stroke adjustment setup

Zero and Span Adjustment for M7284Q, M7285Q, and M7294Q

M7284Q, M7285Q, and M7294Q actuators have the capability of adjustable zero and span. Fig. 10 shows the module with the zero and span potentiometers.

Zero: Sets input voltage to define the 0% angle of rotation. It is factory set to minimum position and can be adjusted to the maximum position of 20mA or 10V.

Span: Adjusts motor response to travel a full stroke through the selected input span. It is factory set to maximum position, and is adjustable from 4-20mA or 2-10Vdc.

1. Adjust the start potentiometer fully clockwise (maximum zero) and the span potentiometer fully counterclockwise (minimum span). See Fig. 10.
2. Set the controller current to the value required to drive the motor to the closed position.
3. Turn the start potentiometer slowly counterclockwise until the motor begins to open. This is defined as the start or zero setting.
4. Set the controller current to the value required to drive the motor to the fully open position. The motor will open.
5. Turn the span potentiometer clockwise until the motor starts to close. The difference between the fully open span position current and the zero position current is defined as the operating span.
6. Recheck the start and readjust the span potentiometer if necessary. Turn the start potentiometer clockwise to increase the zero position.
7. Recheck the span and readjust the span potentiometer if necessary. Turn it clockwise to increase the full span position.
8. For sequential operation, as shown in Fig. 11, repeat the above steps for each motor.

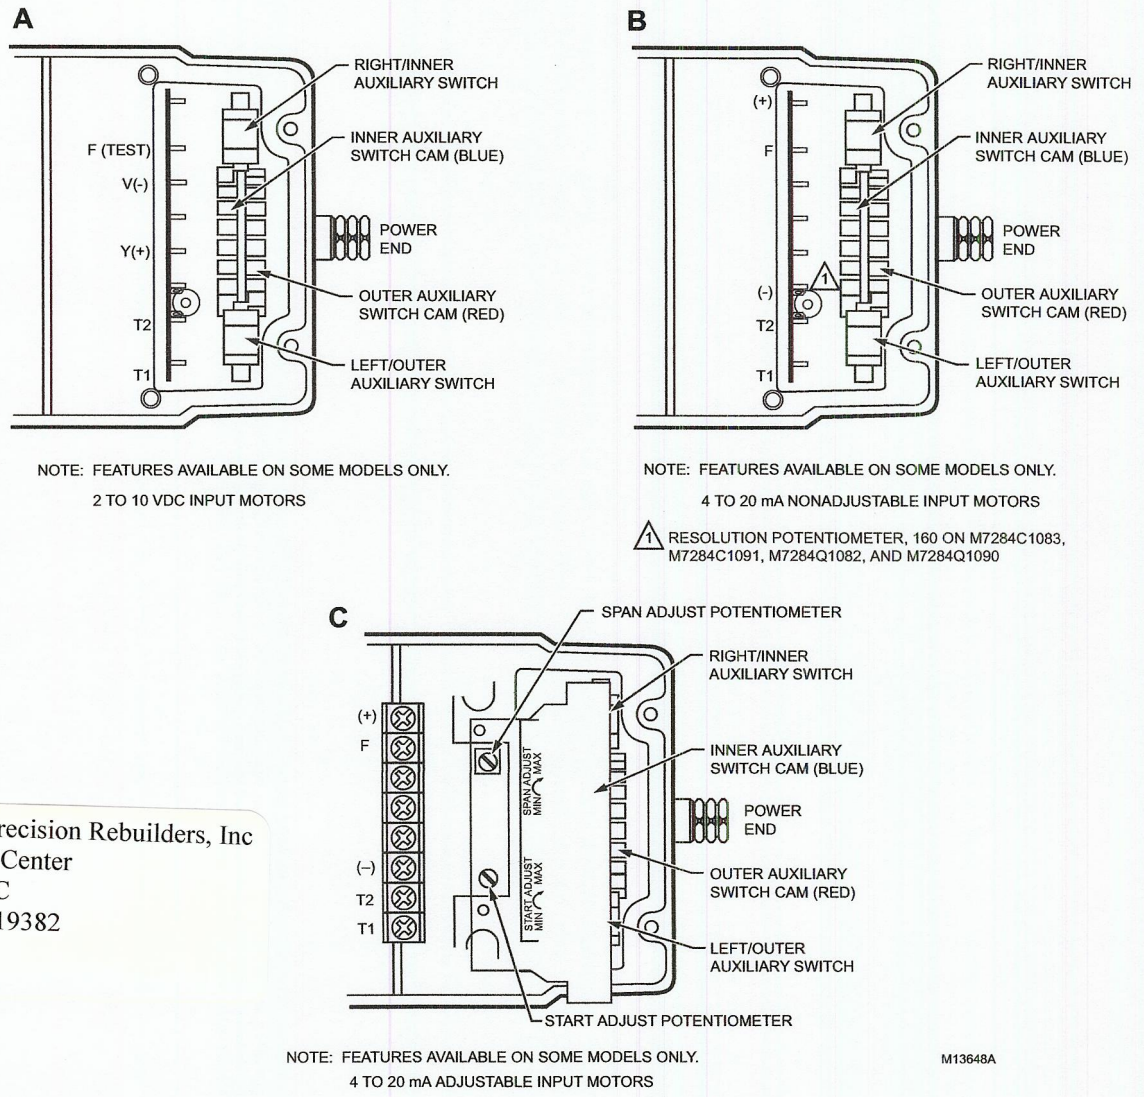

Fig. 10. Terminals and adjustments.

EPRI Edgemont Precision Rebuilders, Inc
Matlack Industrial Center
207 Carter Dr Ste C
West Chester, PA 19382
800-356-3774

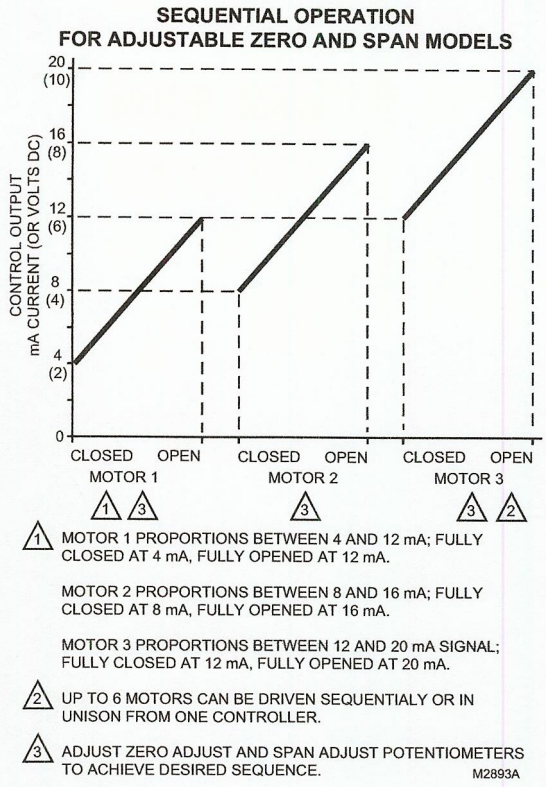

Fig. 11. Sequential operation of motors.

Enhanced Resolution M7284C1083, M7284C1091, M7284Q1082, and M7284Q1090

These four motors have enhanced resolution with 160 repositions (steps) from 90 degrees to 160 degrees stroke.

Auxiliary Switches

⚠ CAUTION

Electrical Shock or Equipment Damage Hazard.
Can shock individuals or short equipment circuitry.
Disconnect all power supplies before installation.
Motors with auxiliary switches can have more than one disconnect.

⚠ CAUTION

Equipment Damage Hazard.
Can damage the motor beyond repair.
Never turn the motor shaft by hand or with a wrench. Forcibly turning the motor shaft damages the gear train and stroke limit contacts.

Adjustable cams actuate the auxiliary switches. These cams can be set to actuate the switches at any angle within the motor stroke. Select switch differential of 1° or 10°.

Motors with factory added auxiliary switches are shipped in the closed position (fully counterclockwise, as viewed from the motor power end) with auxiliary cams set to actuate switches 30° from the closed position and to provide 1° degree differential. With the motor in the closed (fully counter-clockwise) position, the auxiliary switch breaks contacts R-B. See Fig. 12 for auxiliary switch wiring.

Series 2 Motors are shipped with auxiliary switch cams that permit acceptance of 220736A,B Internal Auxiliary Switch Kits. Refer to form 63-2228 for 220736A,B Installation Instructions.

Auxiliary Switch Adjustment

IMPORTANT

When adjusting the auxiliary switch cams use the following procedure:

1. *Insert 1/8 in. screwdriver blade into a slot on cam and move the screwdriver top as far as possible in the required direction. See Fig. 12.*
2. *Repeat step 1 in successive cam slots until the cam is in the required position.*

NOTE: Series 2 Motors are shipped with auxiliary switch cams that permit acceptance of 220736A,B Internal Auxiliary Switch Kits. Refer to Form no. 63-2228 for 220736A,B Installation Instructions.

Use the following procedure to obtain the desired auxiliary switch settings:

1. Remove the top cover from the motor to gain access to the motor terminals and auxiliary cams.
2. Disconnect the controller from the motor.
3. Connect a current source to the positive and negative terminals.
4. Drive the motor to the position where the auxiliary equipment is to be switched by increasing or decreasing the current.
5. For a switch differential of 1°, check continuity of auxiliary switch contacts R-B and rotate the cam as follows:
   a. If the contacts are open, rotate the cam clockwise until the R-B contacts close.
   b. If the contacts are closed, rotate the cam counterclockwise until the R-B contacts open.
6. For a switch differential of 10° rotate the cam approximately 180° so the slow-rise portion of the cam actuates the switch.
7. Check continuity of the auxiliary switch contacts R-B.
8. Rotate the cam as follows:
   a. If the contacts are open, rotate the cam counterclockwise until the R-B contacts close.
   b. If the contacts are closed, rotate the cam clockwise until the R-B contacts open.
   c. Make final adjustment in the proper direction to obtain contact make or break at the desired position.
9. Check for the proper differential and switching of the auxiliary equipment by driving the motor though the full stroke in both directions.
10. Disconnect power, remove current source, reconnect the controller, and replace the top cover on the motor.

NOTE: Changing the differential from 1° to 10° reverses the switching action. For example, with a 10° differential, switch contacts R-B make and R-W break on a counterclockwise (closed) rotation. With a 1° differential, switch contacts R-W make and R-B break on a counterclockwise (closed) rotation.

EPRI Edgemont Precision Rebuilders, Inc
Matlack Industrial Center
207 Carter Dr Ste C
West Chester, PA 19382
800-356-3774

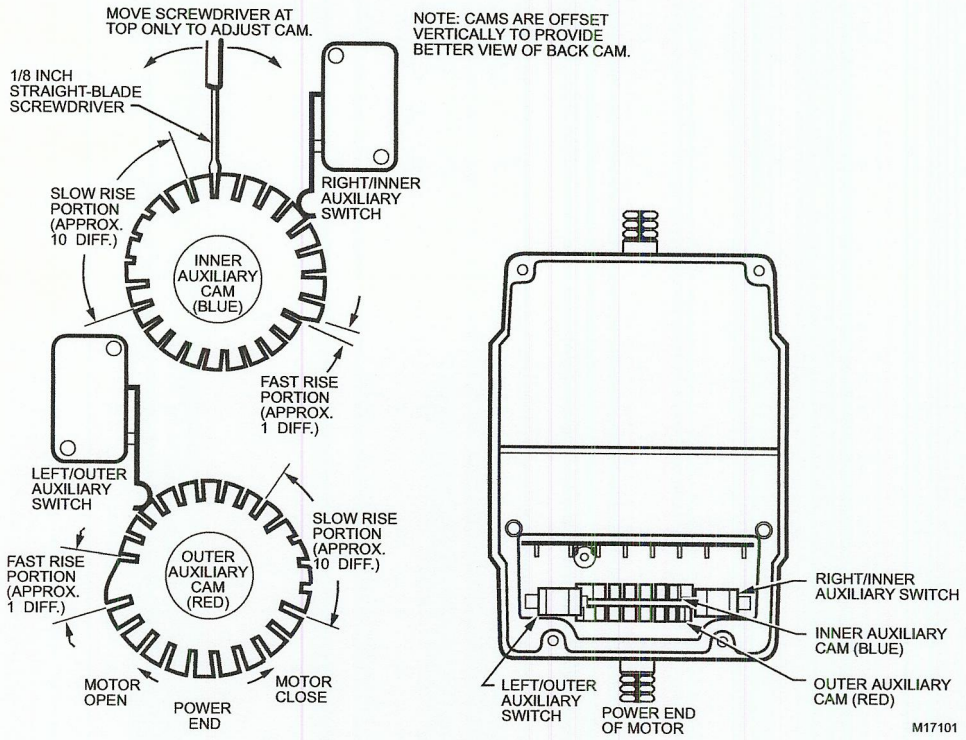

Fig. 12. Auxiliary switch adjustment.

OPERATION AND CHECKOUT

Operation

The internal shaft position feedback potentiometer in conjunction with the actuator microprocessor and modulating input circuit form a control loop. When the external controller's output remains at a fixed amplitude the actuator's shaft position is held at a position proportional to that input amplitude. When the value of the external controllers output changes the actuator responds by initiating movement of the motor to proportionately compensate for the change in input amplitude. When the motor reaches the control loop balance point the system is again in a static state and the actuator holds position until the next change of input from the external controller.

M7685 motor also have a minimum position feature. An external 130 ohm potentiometer wired to terminals 3 and 4 establishes a position beyond which the control input cannot close the motor. If power to the T1-T2 is interrupted the M7685 motor will spring close.

Checkout

After installation and linkage adjustment, operate the motor through the controller. Make sure that:

- The motor properly operates the damper or valve.
- The motor responds properly as the input is varied.
- The auxiliary switch, if used, operates at the desired point of motor rotation.

Inspect the motor, linkage, and valve or damper to see that all mechanical connections are correct and secure.

In damper installations, the pushrod should not extend more than a few inches past the ball joints. Check to see that there is adequate clearance for the linkage to move through its stroke without binding or striking other objects.

See controller or system instructions for additional checkout procedures.

Motor Operation Checkout

Check motor operation as follows:

1. To close the motor, open terminals +, -, and F.
2. To open the motor, connect terminal F to the negative (-) motor terminal.

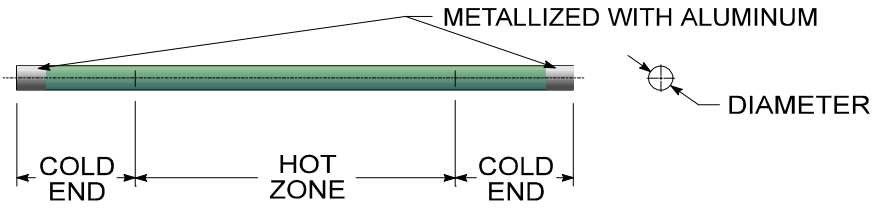
TYPE RR , SILICON CARBIDE HEATING ELEMENTS

GENERAL DESCRIPTION

The RR Starbar is a resistance type silicon carbide heating element. Starbars are rod shaped or tubular depending on the diameter. They have a central heating section referred to as a hot zone and two terminal sections called cold ends. There are two types of RR Starbars. (1)The cold ends are impregnated with silicon metal -- referred to as *one piece*, and (2) low resistance cold ends which are furnace welded to the hot zone -- referred to as a *three piece* or LRE (Low Resistance End) type. This lower electrical resistance cold end causes them to operate at a lower temperature. The extremities of the elements are metallized with aluminum to provide a low resistance contact surface to which the electrical connections are made using braided aluminum straps.



RR Starbars are described by giving the overall length, the heating section length, and the diameter. As an example, RR 43 x 24 x 1 is a Starbar 43" overall with a 24" hot zone, and 1" in diameter.

SUPERIOR PERFORMANCE

Starbars will give you superior performance due to their high density -- approximately 2.4 gms/cc. This gives the Starbar very slow aging characteristics and additional strength.

INTERCHANGEABILITY

Starbars are interchangeable with all silicon carbide heating elements manufactured in the United States as well as higher resistance heating elements manufactured for the Asian and European markets. It is important to provide the nominal electrical resistance when ordering Starbars. Please contact us, before attempting to substitute

SIZES AVAILABLE

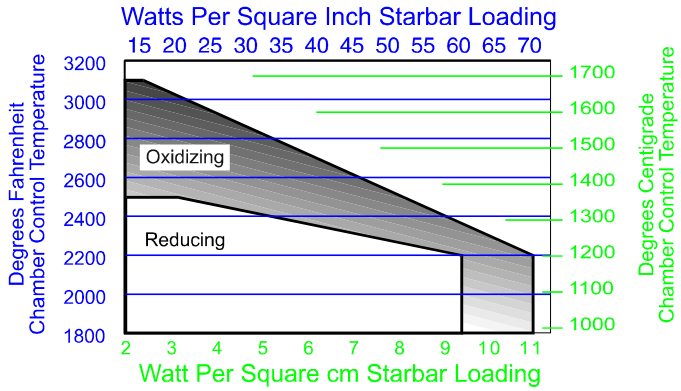
Starbars can be manufactured in any length up to 130 inches (3300mm). The maximum hot zone length is 98 inches (2500mm).

Starbar®

Silicon Carbide Heating Elements

I SQUARED R ELEMENT CO., INC.

Recommended Maximum Watt Loading
(Figure 1)



OPERATING TEMPERATURES

In an air or inert atmosphere of argon or helium the one piece Starbars can be operated at furnace control temperatures up to 3100°F (1700°C), the *three piece* Starbar up to 2600°F (1425°C). In reducing atmospheres the maximum operating temperature is 2500°F (1370°C), see Figure 1. There is a protective coating of silicon dioxide on the silicon carbide. Hydrogen reduces this coating and causes the Starbar to deteriorate. Very dry or very wet hydrogen is detrimental to long service life.

Nitrogen atmosphere applications are limited to 2500°F (1370°C) and 20 to 30 watts per square inch (3.1 to 4.6 watts per square centimeter) maximum surface watt loading. Too high of a surface temperature will result in a silicon nitride reaction. A thermally insulative layer forms around the Starbar resulting in very high surface temperatures which damage the Starbars.

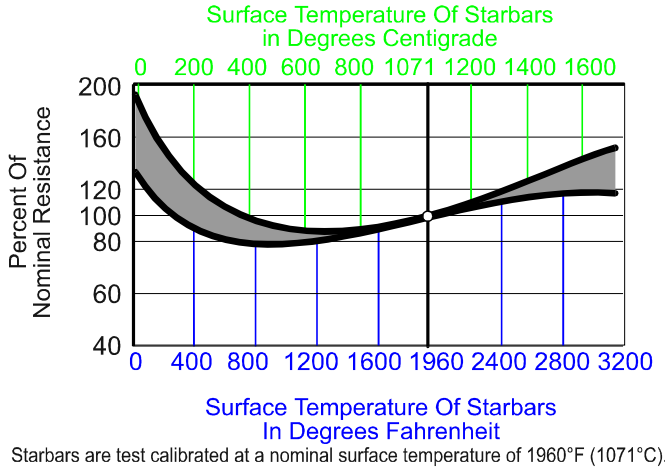
ELECTRICAL CHARACTERISTICS

The silicon carbide Starbar is a linear type resistance heater that converts electrical energy to heat energy -- Joule's Law $W = I^2 \times R$, (W = power in watts, I = current in amperes, R = resistance in ohms).

The Starbar hot zone is a self bonded silicon carbide. The lattice structure or bonds that hold the silicon carbide grain together are formed by recrystallizing the silicon carbide at very high temperatures. Starbars are manufactured of green silicon carbide that is classed as an excess electron type semiconductor.

The electrical resistance of a Starbar is difficult to measure at room temperature due to minor impurities, self heating, and contact resistance. Also the green silicon carbide has a negative resistance temperature characteristic from

Resistance Temperature Characteristics
(Figure 2)



Starbars are test calibrated at a nominal surface temperature of 1960°F (1071°C).

room temperature to approximately 1200°F (650ºC). It turns positive at this point and remains so throughout its normal operating temperature range. A typical resistance temperature characteristic curve of a Starbar is shown in Figure 2.

Nominal Starbar resistance is measured at the calibrating temperature of 1960ºF (1071°C). Nominal resistance values of Starbars in ohms per unit of length are shown in Table A, page 5.

ELECTRICAL LOADING

Starbars are not sized to a specific wattage output like metallic heating elements. The amount of energy that a Starbar is capable of converting from electrical to heat energy depends on the ambient furnace temperature and atmosphere in which the Starbar is operating.

When calculating the wattage capabilities of a Starbar, the unit of watts output per unit of radiating surface area is used. Figure 1 shows the recommended watt loading for a square inch or square centimeter of radiating surface as a function of furnace temperature.

To determine the recommended wattage capabilities of the Starbars start with Figure 1, knowing the furnace temperature and atmosphere in which the Starbars will be operated. Follow the temperature line until you intersect the heavy black line (choosing the appropriate line according to the atmosphere in which the Starbar will be operating). Read the loading in watts per square unit of radiating surface that can be applied to the Starbar. To find the total amount of power one Starbar could supply under these conditions, multiply this value by the radiating surface of the Starbar. The radiating surface area is calculated by multiplying the diameter times the hot zone length times pi (3.14).

Example: At 2750°F the Starbar could be loaded to 35 watts per square inch. Therefore, a Starbar with 10 square inches of radiating surface could supply 350 watts, whereas a Starbar with 200 square inches of radiating surface could supply 7000 watts.

(At 1500°C the Starbar could be loaded to 6 watts per square centimeter. Therefore, a Starbar with 100 square centimeters of radiating surface could supply 600 watts, whereas a Starbar with 2000 square centimeters of radiating surface could supply 12,000 watts).

Example of radiating area:
The RR 43 x 24 x 1 has a hot zone length of 24 inches on a diameter of 1 inch. The radiating surface area is 24 x 1 x 3.14, or 75.4 square inches. (The RR 1092 x 610 x 25 has a hot zone length of 610mm and a diameter of 25mm. The radiating surface area is 610 x 25 x 3.14 or 47,885 square mm, converted to centimeters is 478 square centimeters).

POWER SUPPLY

In the previous paragraph we explained how to calculate the recommended wattage output of the Starbar. Now we shall explain how to compute the electrical requirements to provide the recommended power.

Knowing the wattage output and the resistance of the Starbar you have two parts of an equation with three unknowns. This equation is
$E = \sqrt{}$ (W x R), (E = nominal full load voltage, W = rating of the Starbar in watts, R = resistance of the Starbar in ohms). The resistance of the Starbar can be calculated using the values found in Table A.

When solving for E, you would obtain the voltage required on a nominal resistance Starbar to provide the wattage output desired.

Example: A Starbar RR 43 x 24 x 1 has a resistance of 1.21 ohms and 75 square inches of radiating surface. Loading to 40 watts per square inch, this Starbar could provide 3000 watts. To find the nominal voltage solve for E.

$E = \sqrt{}$ (W x R)
$E = \sqrt{}$ (3000 x 1.21)
E = 60 volts

Starbars may be connected in parallel, series, or combination thereof. Parallel connections are preferred.

In a parallel arrangement the voltage across all the Starbars is the same. In the formula $W = E^2 \div R$, (W = watts, E = voltage, R = resistance) it can be seen that the greater the resistance, the lower the wattage output. The Starbars in the parallel circuit with the lowest resistance will supply more heat energy and therefore operate at a higher temperature. This higher Starbar temperature will cause it to gradually increase in resistance until all the Starbars have the same resistance. At this time the Starbars should all have approximately the same resistance values and surface temperatures and therefore remain in balance.

To compute the network resistance of a group of Starbars the following formula may be used: $Rn = R \times S \div P$ (Rn = network resistance, R = resistance of Starbar, S = number of Starbars connected in a series, P = number of parallel circuits).

Example: Eight Starbars RR 43 x 24 x 1 (R = 1.21 ohms) connected 2 in series (S = 2) and 4 parallel groups (P = 4).

$Rn = R \times S \div P$
$Rn = 1.21 \times 2 \div 4$
$Rn = 0.6$ ohms

To compute the nominal voltage required to power a set of Starbars, we shall use a combination of the formulas used in the two previous examples. $En = \sqrt{(Wt \times Rn)}$, (En = nominal network voltage, Rn = network resistance, Wt = total wattage output).

Example: Eight Starbars RR 43 x 24 x 1 (R= 1.21 ohms) connected 2 in series, 4 parallel groups. Each Starbar provides 3000 watts. Wt = 8 x 3000 = 24,000 watts. Rn = 0.60 ohms.

$En = \sqrt{(Wt \times Rn)}$
$En = \sqrt{(24{,}000 \times 0.6)}$
$En = 120$ volts

The resistance of Starbars increases gradually during their useful life. Therefore, some means of keeping the power input to the kiln or furnace at a level sufficiently high to maintain the desired temperature is required.

Historically, expensive voltage varying equipment such as multiple tap transformers or saturable reactors were recommended for all but the very low temperature applications.

Starbars can be used directly on the line (fixed voltages) at temperatures up to 2400°F (1315°C). To compensate for the reduced output as the Starbars gradually age or increase in resistance, the furnace or kiln is initially overpowered by 25% to 50%. This type of arrangement eliminates the expensive voltage varying equipment and has proven very satisfactory in many applications. It is not recommended when fine process temperature control is required.

Assume a furnace will require approximately 24,000 watts after all heat losses and load factors have been considered. Increasing this 24,000 by 25% to 50% gives a wattage requirement of between 30,000 and 36,000 watts.

By taking another look at the previous examples it can be seen that 10 Starbars RR 43 x 24 x 1 connected two in series, five parallel groups on 120 volts would supply the 30,000 watts. If 12 Starbars of the same size were used, the output would be 36,000 watts. Twelve Starbars connected four in series per phase on 240 volts would make a balanced three phase 240 volt network.

The temperature of the kiln or furnace is controlled by an off-on controller. When the Starbars are new they will only be powered for 24/30 or 24/36 of an hour. As the Starbars increase in resistance they will be on for a greater percentage of the time. When they have increased in resistance to a point at which they supply 24,000 watts, they will be on 100% of the time. A SCR (silicon controlled rectifier) or thyrister can also be used.

For applications where close temperature control is desired and/or for temperatures above 2400ºF (1315ºC) a device for increasing the voltage to the Starbars is required. There are several methods of providing this variable voltage source:

(1) The multiple tap transformer is the most common, because it is usually the least expensive. The secondary of the transformer is provided with taps which usually vary in number from 10 to 36. By carefully selecting the voltage taps, the correct voltage output to match the resistance of the Starbars over their complete useful life can be made.

(2) Saturable reactors and induction regulators are used to provide a stepless voltage control. They are also sometimes used with multiple tap transformers.

(3) Capacitor controls are used infrequently. They, of course, will tend to improve a power factor, which makes their use desirable in some areas.

(4) Silicon controlled rectifiers, (SCR) have become quite popular with the advances in solid state devices.

To compensate for the reduced output as the Starbars increase in resistance, a voltage range is required that will compensate for a 100% increase in the Starbar resistance. The following formula may be used to calculate Emax : Emax = $\sqrt{}$(Wt x Rn) x 1.5, (Emax = recommended maximum voltage required to compensate for increase in resistance due to aging and resistance tolerance, Wt = rating of transformer in watts, Rn = network resistance of the Starbars, 1.5 = minimum margin to accommodate the doubling of the Starbar resistance and the +20% resistance tolerance). A higher value will offer slightly longer usable service life.

Example: The transformer is rated at 24 KVA and has a computed nominal full load voltage of 120 volts. (Rn = 0.6, Wt = 24,000).

Emax = $\sqrt{}$ (Wt x Rn) x 1.5
Emax = $\sqrt{}$ (24,000 x 0.6) x 1.5
Emax = 180 volts

Table A

RR Starbar Dimensions				**** RR Electrical Resistance**

* Recommended overall length = 70% of listed maximum length
** All resistance values are +/-20%

The nominal full load voltage and maximum voltage have been computed. When specifying the transformer the nominal full load voltage is usually reduced by 5% to 10% to allow for the minus 20% resistance tolerance of the Starbars. Also, lower voltage taps are usually provided for idling and slow heatups.

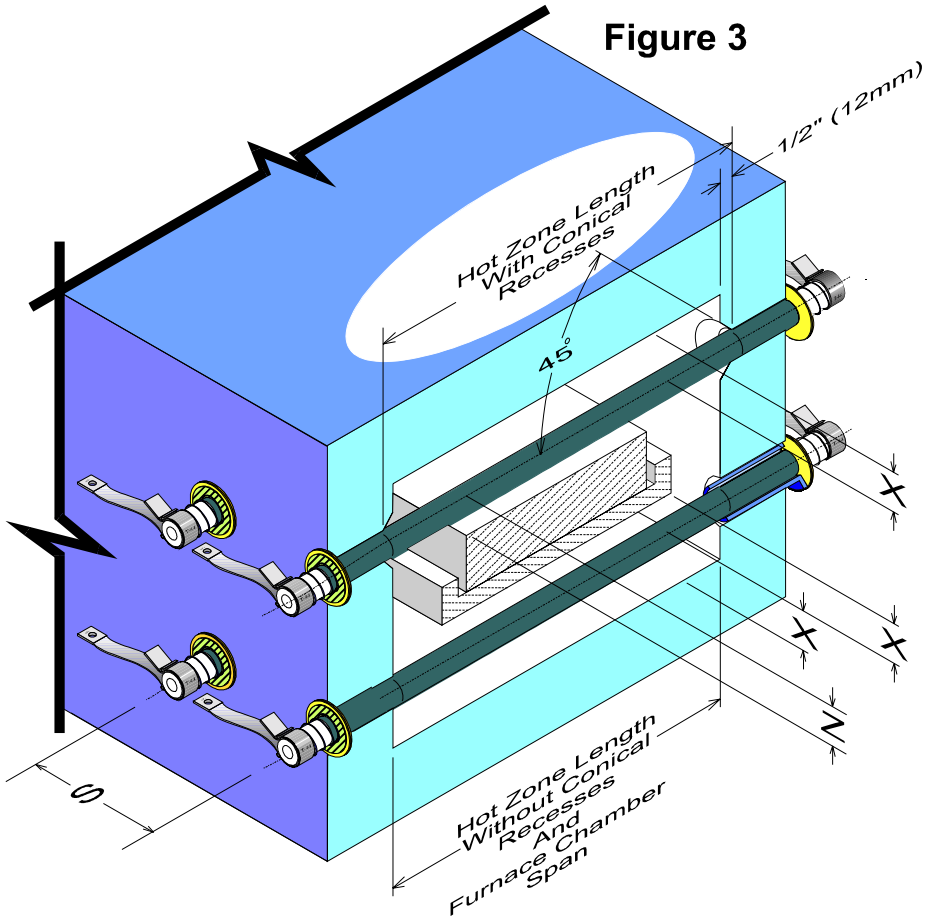
To calculate the minimum voltage, take 70% of the nominal voltage. For periodic applications, take 30% of the nominal full load voltage.

Auto transformers may be used if primary voltage is 230 volts or less. They should not be used in a three phase arrangement. Accepted practice limits the secondary voltage on all transformers to 300 volts. Above this refractory voltage leakage becomes a problem. When computing the size of the voltage steps between taps, a value of 5% of the nominal full load voltage is often used. When SCR or thyrister controls are used on the primary, fewer taps are required. For example, if 6 taps are used, the idling tap can be 0.7 x nominal voltage, then each consecutive tap would be 14% higher. For 8 taps, the idling tap would again be 0.7 x nominal voltage, each consecutive tap at 9.1% higher than the preceding.

EASE OF REPLACEMENT

Starbars can be replaced while the furnace is at operating temperature. The power to the Starbars being changed should be shut off, the spring clips and aluminum braid released, and the old Starbar removed. The new Starbar should be inserted smoothly through the hot furnace with sufficient speed to insure that the aluminum is not melted off the terminal end but not so fast as to cause thermal shock.

Figure 3



Recommended Starbar Spacing

X = 2 x Starbar Diameter is the Minimum, 1.5 x Starbar Diameter is the absolute Minimum and requires a reduced Starbar Surface Watt Loading

Z = S ÷ 1.41 Minimum for Stationary Loads

Z = S ÷ 1.73 Minimum for Moving Loads

S = 2 x Starbar Diameters Minimum

X - is the distance from the centerline of the Starbar to any other reflecting surface, such as a refractory wall or product

Z - is the distance from the centerline of the Starbar to a moving or stationary load

S - is the distance from the centerline of the Starbar to the centerline of an adjacent Starbar

SERVICE LIFE

Starbars increase gradually in resistance with use. This characteristic of increasing in resistance is called aging. Aging is a function of the following:

(1) Operating temperature
(2) Electrical loading (usually expressed in watts per square inch or watts per square centimeter of Starbar radiating surface)
(3) Atmosphere
(4) Type of operation (continuous or intermittent)
(5) Operating and maintenance techniques

MOUNTING

There are no restrictions on the mounting positions of Starbars, although the horizontal and vertical positions are the more common. Extreme caution should be used when mounting to ensure that the Starbars are not placed in tension. There should be adequate freedom to allow for the furnace and Starbars expand and contract independently.

When mounting Starbars vertically they must be supported on the lower end by electrically insulated supports.

Starbars should have their heating sections centered in the furnace chamber so that no portion of the heating section extends into the furnace wall. A conical or truncated cone shaped recess 1/2 inch (13mm) deep is sometimes located on each interior wall where the Starbar passes through. This allows the hot zone to radiate properly and helps maintain a uniform temperature in the kiln.

FURNACE HEATING CHAMBER

The furnace heated chamber dimension, which the Starbar spans, can be the same as the hot zone length of the Starbar as shown by the Starbars under the load in Figure 3. Alternately the furnace heating chamber dimension, which the Starbar spans, can be one inch (25mm) less than the effective heating length of the Starbar. In this case there must be a 45° conical recess in the furnace wall as shown in Figure 3 for the Starbars above the load. Recommended terminal hole diameters for various refractory walls and Starbar sizes are shown in Table B.

Starbars should not be placed closer than two Starbar diameters to each other or one and one half Starbar diameters to a wall or other reflecting body. If the Starbar is not able to dissipate heat energy equally in all directions, it may cause local overheating and possible failure.

Table B
Recommended Minimum Refractory Hole Size

		Minimum Hole Diameter Based on Refractory Wall Thickness									
Starbar Diameter		*100*	*150*	*200*	*300*	*400*	*3*	*5*	*6.5*	*9*	*13.5*

54	2-1/8	61	62	63	65	67	2-3/8	2-7/16	2-7/16	2-1/2	2-9/16

The formula for computing the recommended Starbar spacing to obtain an even temperature gradient on the product being heated is shown in Figure 3.

SPECIFICATIONS AND MATCHING

Starbars have a manufactured tolerance of plus or minus 20% on the nominal resistance. All Starbars are calibrated at least twice prior to shipping to ensure their being within specifications. The calibrated amperage of each Starbar is marked on the carton and right hand end of each Starbar. When installing, arrange Starbars with amperage values as close to each other as available. Longer service life will be obtained when series connected Starbars are matched in resistance. Starbars are shipped as closely matched as possible.

AVAILABILITY

Starbars can be shipped from stock, or two to three weeks after receipt of an order.

CUSTOM CONFIGURATIONS

Special sizes and shapes are available. Cold ends can be different lengths. This, for example, would be applicable for furnaces with arched roofs that require longer cold ends through the roof and shorter through the floor.

Another modification is a two-temperature hot zone. This, for example, would be helpful to get additional heat energy into the lower, more densely loaded tunnel kiln. While this special modified hot zone will not create a specific temperature differential, it does offer a convenient way to get more heat energy into a specific area of a furnace.

The right angle (RA) shown here, has all the electrical characteristics of the RR. The cold ends are attached perpendicular to the hot zone. The RA is normally installed with the cold end through the roof of the furnace.

TERMINAL GASKET ASSEMBLY:

The TGA consists of two ceramic fiber washers, one steel washer, and a spring.

The TGA is used as an alternative to packing ceramic fiber insulation around the Starbar cold end. Ceramic fiber insulation is often used at the cold face of the furnace to help reduce furnace energy losses.

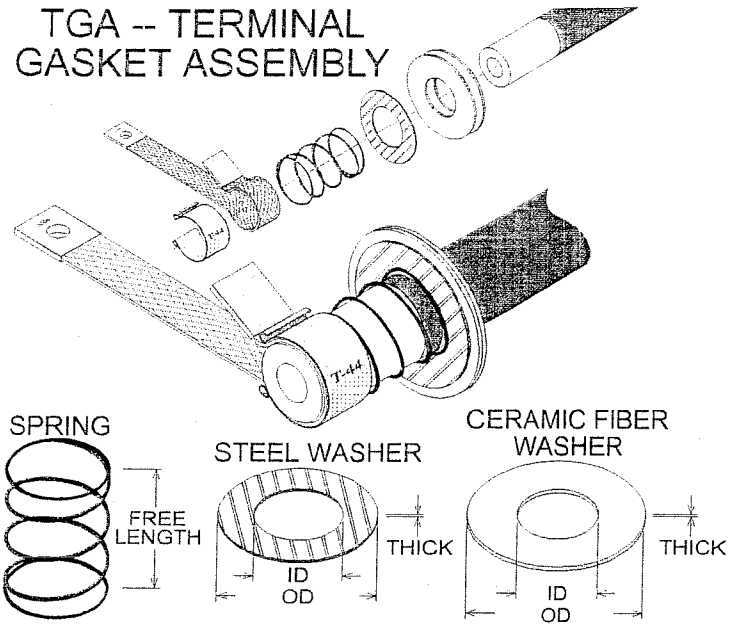
There are advantages to using the TGA rather than packing ceramic fiber insulation around the Starbar. Because the TGA is spring-loaded it allows the Starbar freedom of movement. If ceramic fiber is packed too tightly it can cause tremendous physical stresses to be exerted to the Starbars, possibly leading to failures due to breakage. Freedom of movement is important because there is movement between the Starbars and the furnace walls created by different thermal expansion rates.

Installing of TGA is also quicker than packing with ceramic fiber.

Neither of these methods are intended to be an atmosphere seal. It is to help reduce radiant energy losses, and to a smaller degree some convection heat losses.

There are two free spring lengths, 1 inch (25mm) and 3 inches (75mm). The last digit of the part number is used to call out the free spring length.

AVAILABILITY: Most sizes are available from stock. Others can be shipped in one week, or quicker for emergencies.



Note: The strap and clamp are shown for illustrative purposes and are not supplied with the TGA assembly.

FRL FEATURES

Modular design for service & interchangeability

Miniature (M1), Standard (M2)

Small package size and light weight construction

Competitively priced

FILTERS

M1 has polycarbonate bowl, M2 have polycarbonate bowl with metal guard

STOCK ELEMENTS - 5, 25 or 50 micron

Manual, semi-auto or auto drain available

REGULATORS

Bellofram® Rolling Diaphragm for superior regulator performance

Panel, pipe, or bracket (included) mounting

Metal body, polycarbonate bonnet and knob

Non-rising adjustment knob with push-pull lock ring feature

FILTER REGULATORS

Aluminum and polycarbonate construction

Manual, semi-auto or autodrain available

M1 has polycarbonate bowl; M2 has polycarbonate bowl with metal guard

Non-rising adjustment knob with push-pull lock ring feature

For panel or bracket mounting

Bellofram® Rolling Diaphragm for superior regulator performance

LUBRICATORS

M1 has polycarbonate bowl; remove bowl for filling.

M2 has polycarbonate bowl with metal guard; top plug permits filling without removing bowl or shutting off air

Adjust drip rate by hand, using graduated ring on M1, with screwdriver on M2

FRL ORDERING INFORMATION

SIZE	
Miniature Series	M1
Standard Series	M2

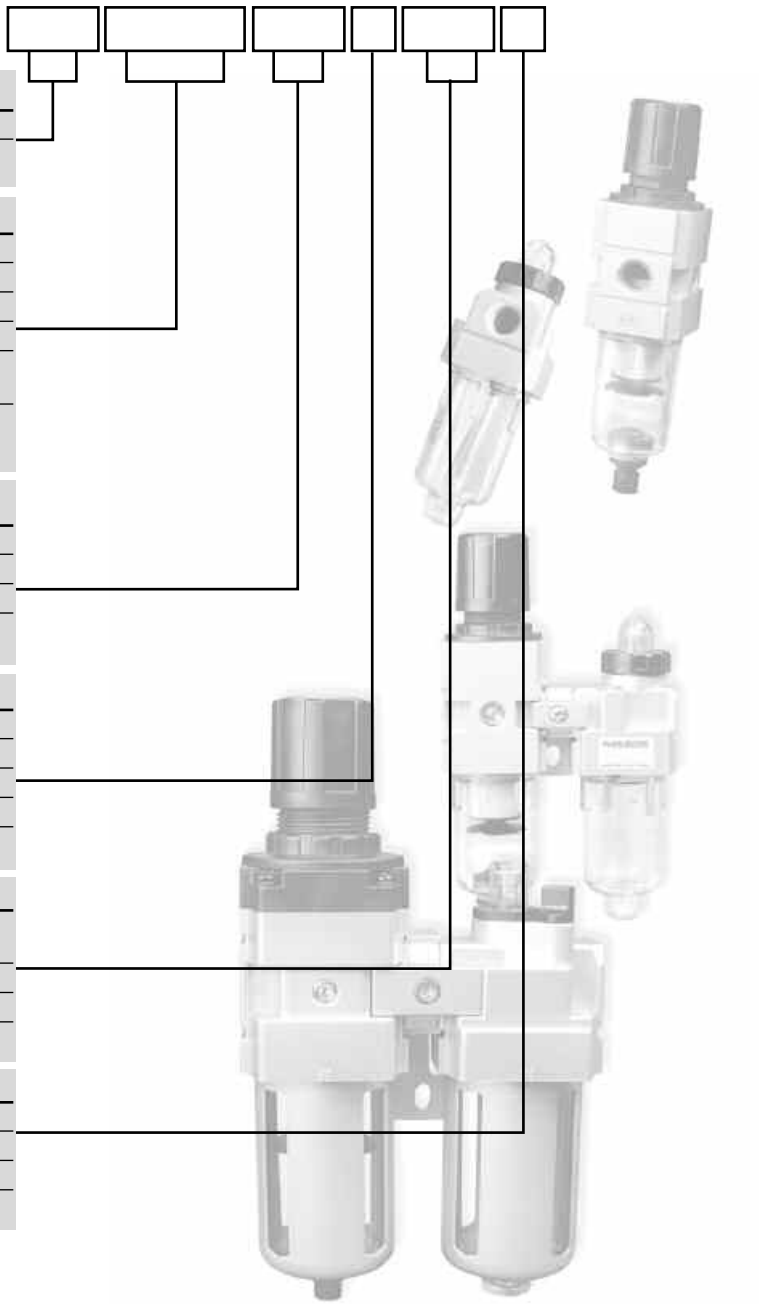
DESCRIPTION	
Filter	F
Regulator	R
Lubricator	L
Filter Regulator	FR
Filter Regulator PLUS Lubricator	FRP
Filter, Regulator, Lubricator	FRL

PORT SIZE	
⅛ NPT (M1 only)	1N
¼ NPT	2N
⅜ NPT (M2 only)	3N
½ NPT (M2 only)	4N

PRESSURE RANGES	
0-10 psi	A
0-30 psi	L
0-60 psi	M
0-120 psi, Standard	H
Omit for Filters & Lubricators	

FILTERS	
50 Micron Filter, Standard	C
25 Micron Filter	B
5 Micron Filter	F
Omit for Regulators & Lubricators	

DRAIN	
Manual Drain, Standard	M
Semi-Automatic Drain	S
Auto Drain (M2 only)	A
Omit for Regulators & Lubricators	



NOTE: Individual regulators, FRs, filters, and lubricators come complete with bracket .

FRL assemblies come complete with all bracket/connectors.

Pressure Gauges - "GG" Series Gauges pg. 9

MARSHALLTOWN VALUE SERIES GAUGE

- ASME Grade B Accuracy
- Extra Savings with Quantity Pricing
- 4 Standard Mounting Options: LM, CB, Right & Left

Marshalltown Value Series are the most economical, general purpose gauges in the Marsh gauge line. Suited for use with water, oil, air, gas, or other non-corrosive media.

Typical applications include FRL's, compressors, pumps, boilers, regulators, dryers as well as commercial and industrial equipment.

POINTER
Aluminum, Black painted

WINDOW
Flat plastic with steel friction ring

GENERAL SERVICE GAUGE

- Dial Sizes: 1½", 2", 2½", 3½" & 4½"
- Superb quality, economical price
- Pressure ranges to 5000 psi

Marsh Instruments General Service Steel Case Gauges are an economical, general purpose gauge for pressure measurement from vacuum/compound through 5,000 psi. Suited for use with water, oil, air, gas, or other non-corrosive media.

Typical applications include FRLs, compressors, pumps, boilers, regulators, dryers as well as commercial and industrial equipment.

40MM & 50MM SEVERE SERVICE GAUGE

- Copper Alloy Internals
- Glycerine Filled
- Center Back Mount Only

Marsh Instruments Liquid-Filled Gauges are designed to perform in rugged and harsh environmental conditions - especially where pulsation and vibration is a problem. Liquid Filled Gauges offer a significant cushioning and dampening effect, reducing pointer flutter and internal gauge damage. Liquid Filled Gauges feature a ventable top fill plug and can be mounted on a horizontal or vertical plane. The hermetically sealed construction reduces the chance of leaks and makes field filling an easy option.

Typical applications include refineries, chemical, oil & gas, marine and OEM processes.

63MM SEVERE SERVICE GAUGE

- 3 Standard Mounting Options: LM, CB and U-Clamp
- Glycerine Filled
- Ranges to 10,000 psi

Marsh Instruments Liquid-Filled Gauges are designed to perform in rugged applications and harsh environmental conditions - especially where pulsation and vibration are a problem. Liquid Filled Gauges offer a significant cushioning and dampening effect, reducing pointer flutter and internal gauge damage; also lubricating the internals, and reducing corrosion.

All stainless steel Liquid Filled Gauges feature a ventable top fill plug for pressure relief and ease of venting after installation. Pressure ranges are available through 10,000 psi, with high pressure ranges offering a Helical Bourdon Tube for longer gauge life and increased durability. The hermetically sealed construction reduces the chance of leaks, and makes field filling an easy option.

Typical applications include refineries, chemical plants, offshore platforms, oil rigs, marine applications, general industrial application and OEM processes.

63MM & 100MM BRASS GAUGE

- Forged Brass case (one piece construction)
- Ranges to 10,000PSI
- Heavy Duty Performance

Marsh forged brass gauges are designed for top performance in rugged applications and harsh environments, where corrosive gas or media is not an issue. Applications include Oil patch, Hydraulics, Natural gas, OEM and General Industrial applications where superior quality is required. Liquid Filling protects against pulsation and vibration offering a cushioning and dampening effect. The hermetically sealed one piece design reduces the chance of leaks and allows field filling as an easy option.

100MM STAINLESS STEEL GAUGE

- Liquid Filled or Dry
- Field Fillable
- Ranges to 10,000 psi
- Heavy Duty Stainless Steel

Marsh Instruments Stainless Steel Gauges are built for extended life, and designed for harsh and corrosive environments. These stainless steel gauges feature top fill plugs and are field fillable. Pressure ranges are available to 10,000 psi. Marsh Liquid Filled Gauges offer significant cushioning and dampening which reduces pointer flutter and internal gauge damage.

Typical applications include refineries, chemical plants, offshore platforms, oil rigs, marine applications, general industrial application and OEM processes.

QUALITY SERIES 100MM STAINLESS STEEL INTERNAL GAUGE

- Liquid Filled or Dry - Field Fillable
- Adjustable Micrometer Pointer
- Ranges to 15,000 psi
- Safety Glass Window

Marsh Stainless Steel gauges are built for extended life and are designed for harsh and corrosive environments.They feature a top fill plug, polished bayonet ring and are field fillable. Liquid filled gauges offer significant cushioning and dampening plus extend the life of a gauge.

Typical applications include Oil patch, Refineries, Oil Rigs, Control Panels, Offshore Platforms, Marine and General Industrial.

TEST GAUGE +/- 0.5%

- Adjustable Micrometer Knife-Edge Pointer with Mirror Dial
- Stainless Steel Movement
- Dial Size: 4½"
- Ranges to 10,000 psi

The Marsh Test Gauge is designed with a black painted steel housing and the choice of copper alloy or 316 stainless steel tube and socket to meet the demanding service needs of various test gauge applications. Accuracy is ±0.5% of full span. A highly polished integral mirror is positioned between the two graduation arcs on the dial face The knife-edge pointer is reflective so that, when the pointer and its reflection are in alignment, parallax is virtually eliminated and a true dial reading is assured.

Typical applications include test stands, aviation ground support, petroleum, chemical, utilities, industrial vessels and panel builders.

MASTER TEST GAUGE (SERIES 'D')

- Knife-Edge Pointer with Mirror Dial
- External Dial Adjustment
- Dial Size: 6"
- Ranges to 10,000 psi

Marsh Master Test Gauges are used in precision laboratory applications and industrial environments where precise accuracy is demanded. For pressure readings to 10,000 psi, Marsh Master Test Gauges offer dependable, consistent accuracy within ±0.25% of span, meeting all requirements of ASME Grade 3A specifications. The pressure relieving blowout plug provides the increased safety required for potentially dangerous applications.

Typical applications include lab's, universities, automotive testing, government test facilities and pharmaceutical.

INSPECTOR'S TEST GAUGE

- 3" Dial
- Vacuum to 1,000 psi Range
- Recalibrator on Dial Face
- ASME Grade 2A Accuracy

Marsh Inspector's Test Gauges are specifically designed for use by steam boiler, air brake and pressure system inspectors. The rugged 3" Inspector's Test Gauge features a nickel-plated case and an accuracy of ±0.5% of span. The bushed Mastergauge movement with Recalibrator is standard for these gauges. Mating parts are of dissimilar metals to prevent seizing. Bearing sleeves are of bronze, and the sector is brass.

Typical applications include steam boiler, air brakes, pressure system inspectors, and for use on other testing applications.

PROCESS GAUGE

- 4½" and 6" Dials
- 4 Safecase Designs
- Pressure Ranges Vacuum to 20,000 psi
- Dry or Liquid Filled
- Micrometer Pointer

Marsh Process Gauges are the industry standard in performance. With over 125 years of proven experience, Marsh offers the most complete line of process instrumentation in the industry. An extensive list of designs and options makes the Marsh line of Process Gauges the intelligent and practical choice in process instrumentation. All case styles feature safecase solid-front construction.

Typical applications include chemical and petroleum chemical processes, compressors, power plants and oil platforms.

DIAPHRAGM GAUGES

- Dial Sizes: 2½", 3½", 4½"
- Four Case Styles
- Accuracy: ASME B40.1 - 2/1/2%

Marsh Instruments Low Pressure Diaphragm Gauges are universally known for their dependable performance and accuracy. Incorporating a unique design feature, the diaphragm element in this gauge allows accurate low pressure readings in a variety of applications. Featuring a bronze diaphragm element, the gauge is capable of ASME Grade A-1% accuracy for ranges above 30" of water. Ranges are available in vacuum and pressure in inches of water, ounces per square inch and millimeters of mercury.

Typical applications include HVAC systems and low pressure gas burner systems.

GAS TEST GAUGE

- Hex or Bell Type mounting
- 15 to100 Psi pressure ranges
- Steel case and brass internals

Use to pressure test all new gas installations for leaks and passing inspection codes. After installing Gas Test Gauge, the system is pressurized with air. Any leakage will be indicated by a pressure drop on the gauge.

Typical applications include testing of gas and other pressure media.

SERVICEMAN'S TEST GAUGE

- Recalibrator and Restrictor Standard
- Heavy Duty Brass Case
- Clam Shell Packaging Optional

Marsh Instruments Deluxe Serviceman's Test Gauge is designed to assure the modern serviceman the best possible gauge for testing refrigeration equipment. Corresponding, easy-to-read temperature scales are printed in red on the inner arcs of the dial face.

Typical applications include testing, servicing and recharging AC and R systems.

MANIFOLD GAUGE

- Recalibrator and Restrictor Standard
- Color Coded Cases, "Reds" & "Blues"
- Overpressure Protection to 350 psi

These gauges are designed for the pressure measurement of refrigeration systems. All dials are furnished with corresponding temperature scales for the various refrigerants. Dials feature R-12, R-22, and R-502. Standard connections are ⅛ NPT lower mount with your choice of red or blue case.

Marsh Manifold Gauges are used in refrigeration applications for testing, servicing, and recharging AC and R Systems.

REFRIGERATION AMMONIA GAUGE

- Range 30" Hg to 150 psi or 300 psi
- Case Sizes: 63mm and 3½"
- ASME Grade B

Marsh Ammonia Gauges include a restrictor that protects the gauge against sudden shock or pulsating pressure. The inner dial arc shows pressure, outer arc shows the corresponding temperature scale. Marsh Refrigeration Ammonia Gauges are available in a stainless steel case.

Marsh Instruments Refrigeration Ammonia Gauges are designed for use on ammonia compressors and other ammonia refrigeration equipment.

REFRIGERATION GAUGE

- Color Coded Dial
- Adjustable Pointer Standard

Marsh Refrigeration Gauges are sturdily constructed and tested to give long, continuous, accurate service. In addition to the standard pressure or compound scale, dials also show the corresponding temperature scales for R-12, R-22, and R-502, in the various combinations shown in the chart below. Dial markings are sharp, clear and easy to read.

Marsh Instruments Refrigeration Gauges are designed specifically for use on refrigeration systems.

CONTRACTOR'S GAUGE

- 4½" Dial
- Polished Stainless Steel Case
- Adjustable Pointer
- 1% Accuracy

Marsh Instruments Contractor's HVAC Service Gauge is a newly redesigned gauge with a long-life movement to meet the needs of contractors in air conditioning, heating, plumbing and refrigeration. This rugged and reliable gauge is economically priced and offers many features normally found on more expensive gauges such as adjustable pointer, acrylic lens and polished stainless steel case.

Marsh Instruments Contractor's Gauges are designed for use on plumbing and HVAC equipment.

HEATING SYSTEM GAUGE

- Adjustable Set Hand
- Ranges to 300 psi and 690 Feet of Water
- 3½" and 4½" Dials

Marsh Instruments Heating System Gauges are available in 3½" and 4½" dial sizes in the most popular ranges. An adjustable red altitude pointer is standard on feet-of-water gauges. This feature allows the user to indicate the head of water to be maintained in the system.

Marsh Instruments Heating System Gauges provide accurate psi and feet-of-water measurements in elevated tanks, reservoirs, standpipes, and similar applications where reliability and dependability are crucial in heating system equipment.

WATER TEST GAUGE

- Connects Directly to Standard Water Faucet or Hose
- Measures Commercial & Residential Water Pressure
- Dual Scale Dial

Marsh Water Test Gauge is designed to connect directly to a standard ¾" water faucet or hose. The maxi pointer included on the Water Test Gauge allows you to monitor a peak operating or surge pressure point.

Typical applications include measuring residential and commercial water pressure, also selection and adjustment of valves, regulators, and other controls.

PAPER MACHINE GAUGE

- Hinged Ring Chrome Plated Steel Case
- Protective Weather Tight Seal
- Restrictor is Standard

Marsh Instruments Chrome Plated Paper Machine Gauges are available in nine ranges and fit existing panel cutouts. The heavy-duty case features a front flanged/ hinged ring design which allows easy access to the recalibrator and a weephole that prevents condensation buildup. A restrictor is standard. The Marsh Paper Machine Gauge is available in 3½" size only. Each gauge has a weather-tight seal to protect against dust and atmospheric contaminates.

Marsh Instruments Paper Machine gauges are specifically designed to meet the demands of the pulp and paper industry.

X-MAS TREE GAUGE

- Accuracy ±1%
- Polished Stainless Steel Case
- Ranges to 10,000 psi
- Adjustable Micrometer Pointer

Marsh Instruments has been on top of X-mas Trees and well-heads longer than any other name. Marsh offers the same high-performance gauge for replacement. Other gauge manufacturers can state X-mas Tree Gauge on their products but only Marsh Instruments can offer you all the special features, and dependability, that you expect! Features include a polished stainless steel case with stainless steel tube, tip, and socket, and an easy to adjust micrometer pointer.

Marsh Instruments X-mas Tree gauges are designed for the oil patch, well heads and offshore oil platforms.

Diaphragm Seals

MODEL 12000 MINI SERVICEABLE RUBBER DIAPHRAGM SEAL

The Model 12000 Serviceable Mini Diaphragm Seal is designed for gauges and instruments with operating pressures of 2500 psi with stainless and 500 psi with PVC models. Ideally suited for small applications and corrosive installations. The optional 'Easy Clean Out' feature allows the removal of the process side housing without losing the instrument side fill fluid. Fill / bleed screw port in the instrument side housing, and stainless steel build screws are standard.

FILLED & CALIBRATED TO GAUGES ONLY.

MODEL B8498 GAUGE PROTECTOR WITH RUBBER DIAPHRAGM SEAL

The Model B8498 Gauge Protector is designed for extremely high volume displacement. Ideally suited for gauges and instruments with operating pressures up to 200 psi and vacuum applications. Available in ¼" threaded connections and chrome plated zinc construction. A ⅜" flush plug is standard in the process side housing.

FILLED & CALIBRATED TO GAUGES ONLY.

Diaphragm seals are isolation devices which separate pressure gauges and other instruments from the process media while allowing the instrument to measure the process pressure. The service life of the instrument is greatly extended, because it is protected from corrosion, clogging, freezing, or pulsation.

MODEL 13000 MINI / ALL WELDED DIAPHRAGM SEAL

The Model 13000 Mini Welded Seal is designed for 2" to 3½" bourdon tube gauges with a minimum pressure of 100 psi. The maximum operating pressure is 2000 psi at 100º F. Available in all 316 SS or Hastelloy C process housing and diaphragm.

FILLED & CALIBRATED TO GAUGES ONLY.

MODEL 13040 ALL WELDED DIAPHRAGM SEAL

The Model 13040 All Welded Seal is designed for 2" to 4½" bourdon tube gauges with pressure ranges from vacuum to 1000 psi. Available in all 316SS or Hastelloy C process housing and diaphragm, with threaded connections. Optional flushing connections also available.

FILLED & CALIBRATED TO GAUGES ONLY.

Diaphragm Seals

MODEL 14000 REMOVABLE DIAPHRAGM SEAL

The Model 14000 Diaphragm Seal is a clamped metal design featuring interlocking construction inside the bolt circle for perfect alignment. The upper and lower housings clamp the diaphragm in place and allow for field servicing. The 14000 is available in threaded connections for pressures from vacuum to 2500 psi. Fill/bleed port screw in the upper is standard and an optional flush connection is available.

FILLED & CALIBRATED TO GAUGES ONLY.

MODEL 14040 WELDED DIAPHRAGM SEAL

The Model 14040 Welded Diaphragm Seal is a welded diaphragm-to-upper design allowing the upper housing to be removed with the instrument in place without losing fill. The same interlocking feature as the 14000 is used to assure alignment of the upper to the lower. Available in threaded connections for pressures from vacuum to 2500 psi. Fill/bleed port screw in the upper is standard and an optional flush connection is available.

HOT WATER THERMOMETER

- ±1% of span throughout entire range
- Aluminum stem and case material
- Bi-metallic element

Thermometer is available with standard ½" or ¾" NPT male separable socket or ½" or ¾" sweatwell connection that allows easy thermometer removal while maintaining a "sealed" system.

Marsh Instruments Hot Water Thermometers are designed for accurate temperature readings in hot water lines, boilers and hydronic systems.

DESCRIPTION	P/N

BIMETAL THERMOMETERS

- External Reset Feature for Field Recalibration (3" & 5")
- 9 Dual Scale Ranges to 1,000°F (525°C)
- Hermetically Sealed Case Design
- 2", 3" and 5" Dials
- Stem Lengths to 24"
- 1% Full Scale Accuracy

Marsh Instruments Bimetal Thermometers combine the benefits of economy and reliability for local mounted temperature indication in the dual scale ranges from -50° to 1,000°F (-40° to 525°C). Additional advantages offered by the Series "L" Bimetal Thermometers include an easy-to-read dual scale, fast speed of response, and accurate temperature indication. The hermetically sealed and ruggedly built case is resistant to shock, vibration, dust and moisture. Corrosion resistance to most chemicals is provided by the all welded type 304 Stainless Steel construction. The extremely responsive bimetal sensing element provides an accuracy to within ±1% of scale. An external adjustment screw on the back of the 3" and 5" case provides convenient reset and field recalibration. Built-in over range protection is a standard feature.

Typical applications include process, offshore, power, chemical industries, HVAC and OEM applications.

POCKET THERMOMETER

- 1" Dial
- 304 Stainless Steel Hermetically Sealed Case
- 5" long stem
- Protective Case with Stainless Steel Clip

Marsh pocket thermometers have a 1" dial, 304SS hermetically sealed case, 304SS 0.4mm diameter 5" long stem, and plastic lens. The accuracy is ±1.5% of scale range. Each unit comes with a protective case with SS clip, that allows it to be safely carried in your pocket and also can be used to hold the thermometer in the medium to be tested.

Typical applications include the food industries, HVAC/R industries, and any applications requiring fast and accurate temperature.

INDUSTRIAL THERMOMETER

- Standard Well & Lagging Well Option
- Mounting Options: Adjustable Angle
- Easy to Read Dual Scale
- 5 Temperature Ranges
- Aluminum or Molded Glass Fiber Case

Marsh Industrial Thermometers are designed for demanding applications. The large 9" scale permits easy reading at longer distances. The glass-reinforced nylon case is lightweight yet rugged enough for demanding installations. The adjustable stem can be locked into any position through a 180° arc. These thermometers are commonly used on hot or chilled water lines in commercial/industrial buildings.

The Marsh Industrial Thermometers have a compact design that is well suited for limited space applications such as diesel engines, steam turbines, reduction gears, pumps, condensers and pipelines.

DIGITAL PRESSURE INDICATOR

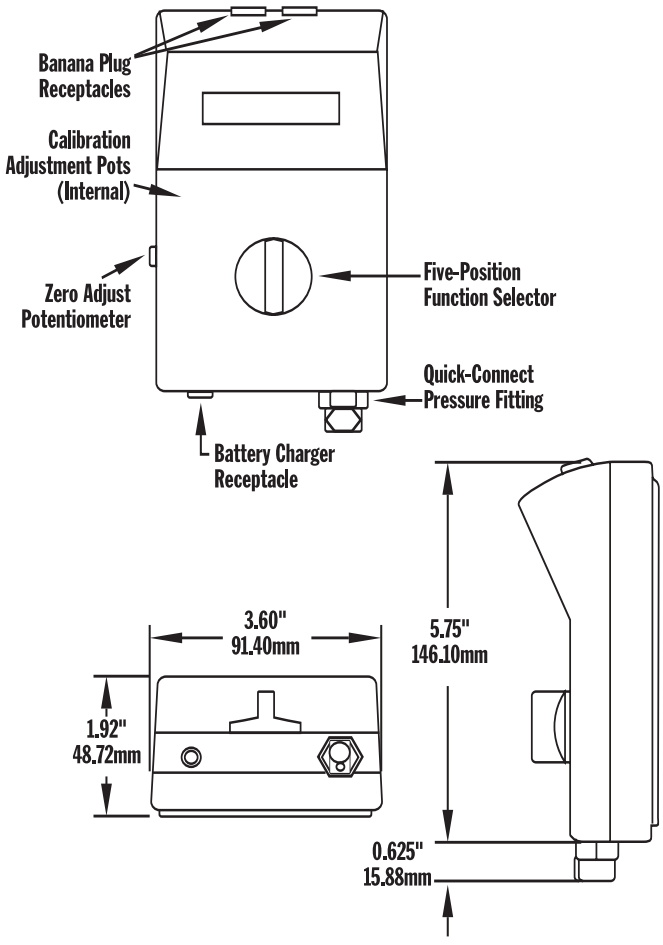
- Converts Pressure Input to LCD Digital Readout
- High Accuracy in Lightweight, Portable Package
- State of the Art Semi-Conductor

The Marsh Instruments Digital Pressure Indicator is portable, lightweight, hand-held testing and calibrating instrument indicates pressure to 50 psig at accuracy levels of ±0.50% of reading ±1 count. A state-of-the-art semiconductor-type pressure transducer converts pressure input to analog voltage, which is displayed on a 3½ digit LCD readout. Internal 9-volt rechargeable battery powers the indicator, and a zero adjust potentiometer standardizes the transducer bridge at zero pressure for higher accuracy.

Marsh Instruments Handheld Digital Pressure Indicator and Calibrator is ideal for calibrating DP cells, I/P's and P/I's. The indicator tests installed instruments and transmitters, verifies operation and settings of valves and switches, detects system leaks, and is used for other testing or maintenance applications.

	DIGITAL PRESSURE INDICATOR
RANGE	PART NUMBER
-14.7 to 50p	4-DPP-20050-BBC
-14.7 to 60p	4-DPP-20060-B3
-14.7 to 200p	4-DPP-20200-BBC

NOTE: Connection: 5/16" quick connect tube fitting
Elec. Range: 0-200 MA



SPECIFICATIONS

PNEUMATIC RANGE
Range:–14.7 to 200 psig; with corresponding inches of water column and inches of mercury

WETTED MATERIAL
Brass fitting, silicone wafer diaphragm, suitable for instrument air (clean & dry) or any clean, non-conductive fluid

PRESSURE FITTING
5/16" quick-connect tube fitting standard, with mating nickel-plated brass locking quick-connector. 8" plastic hose with ferruleless ¼" OD has to coupling insert with shutoff valve

DISPLAY
3½" digit LCD, ½" high black numerals on light background, with polarity and low battery indicators

ACCURACY
±0.5% of reading ±1 count, must be zeroed at barometric pressure

TEMPERATURE
Calibration range: 50°-90°F.
Operating range: 30°-130°F.
Effect of temperature outside calibration range is ±0.01% per degree F

POWER
Internal: 9-volt transistor battery, Ni-Cad chargeable. External: 12-volt adapter will power unit or charge battery in approx. 14 hours. Approximate operation is 8-10 hours per charge

CASE SIZE
3.60" wide x 5¾" long x 1.92"high, ABS plastic

INCLUDES
Carrying case, battery charger, 8" plastic hose, quick-connect fitting, and technical manual

SELECTION AND USE OF A PRESSURE GAUGE

When selecting a pressure gauge, it is important to consider the following factors to insure safety and accuracy:

1. Pressure range
2. Temperature range
3. Conditions affecting wear of the system
4. Case venting
5. Pressure fluid composition
6. Pressure fluid temperature
7. Ambient conditions
8. Method of mounting
9. Required accuracy

PRESSURE RANGE: A range of 2 times the operating pressure is recommended for safety and extended gauge life. The operating pressure should be limited to the middle 75% of range.

TEMPERATURE RANGE: Ambient temperature for General Service ("J") is -40° to 160°F. Ambient temperature for Severe Service ("J" & "X"), for Dry Gauges is -40° to 160°F and for Liquid Filled is 0° to 140°F.

SHOCK, VIBRATION, PULSATION, OR CORROSIVE ATMOSPHERE CONDITIONS: Liquid Filled Gauges have a fill material to lubricate the movement and reduce friction and wear. When used with a restrictor these gauges absorb vibration and dampen pressure shock and spikes. Liquid filling also prevents moisture or a corrosive atmosphere from affecting the gauge internals.

CASE VENTING: Process (Series "P") and Elite (Series "W") have a internal diaphragm which compensates for atmospheric changes that could affect the calibration of the filled gauge. Severe Service (Series "J" & "X") and 100mm (Series "HW") liquid filled gauges have an elastomeric vent fill plug tip which can be easily cut to permit case venting.

PRESSURE FLUID COMPOSITION: Since the sensing element of a pressure gauge may be exposed directly to the measured medium, consider the characteristics of this medium. It may be corrosive, it may solidify at various temperatures, or it may contain solids that will leave deposits inside the sensing element. For pressure fluids that will not solidify under normal conditions or leave deposits, a Bourdon Tube Gauge is acceptable Diaphragm Chemical Seals should be considered when gauge wetted parts are not compatible with the measured media. A chemical compatibility chart follows this section to aid in the selection of the proper sensing element or diaphragm seal material.

PRESSURE FLUID TEMPERATURE: Steam and other hot media may raise the temperature of the gauge components above safe working limits of the sealed joints. In these cases it is recommended that a syphon, cooling tower or chemical seal be used in conjunction with the pressure gauge Diaphragm Seals and remote capillary can also be considered for use with gauges or transducers which are subjected to very low or high ambient temperature.

AMBIENT CONDITIONS: The normal ambient temperature range for Marsh Instruments gauges is -40° to 160°F (-40° to +71°C) for Dry Gauges, –4° to 140°F (–20° to 60°C) for Glycerine filled gauges, and –40° to 140 °F (–40° to 60° C) for Silicone filled gauges. The error caused by temperature changes is ±0.3% per 18°F rise or fall, respectively. The reference temperature is 70°F (20°C). The correction is for the temperature of the gauge, and not the temperature of the measured medium. Remote gauge mounting using a diaphragm seal and capillary line is one alternative for applications involving extreme ambient temperature.

Moisture and weather effects must also be considered. Liquid Filled Gauges prevent condensation build up. For outdoor use, stainless steel, brass, or plastic cased gauges are recommended.

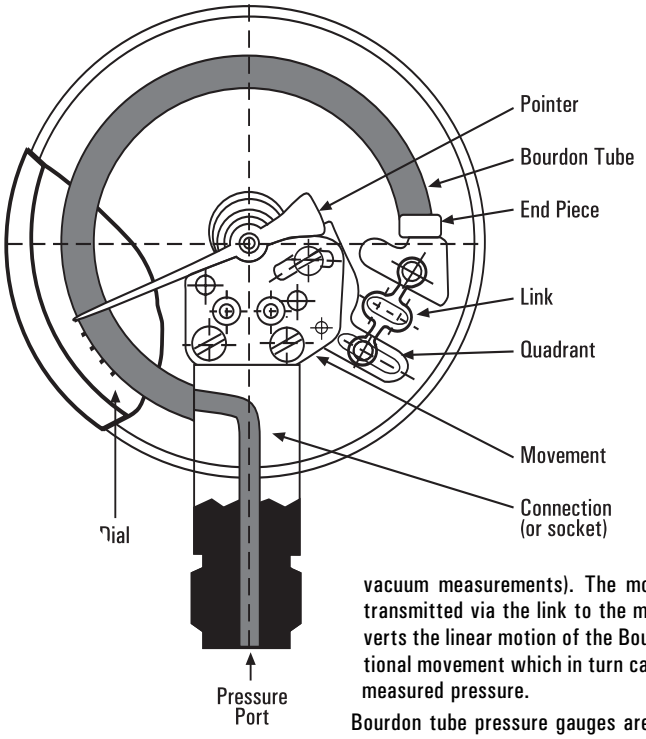
PRESSURE GAUGE OPERATING PRINCIPLE



Bourdon tube pressure gauges are widely used in all branches of industry. The construction is simple yet rugged, and operation does not require any additional power source. The Bourdon tube element is directly exposed to the medium being measured and is normal made of copper alloy (brass) or stainless steel as the application demands.

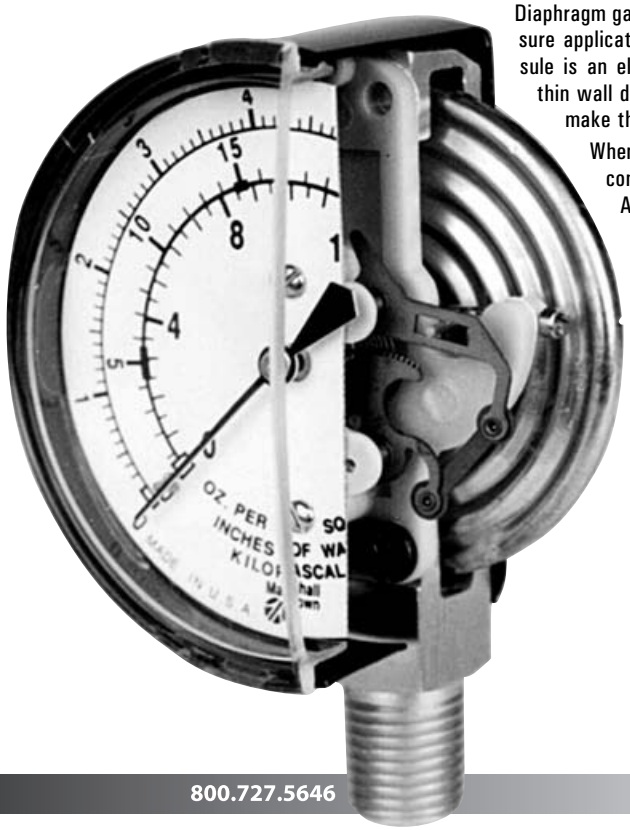
The Bourdon tube measuring element is made of a thin walled tube that is either bent into a semi-circle (C-Shape tube) or spirally wound (coiled safety tube). When pressure is applied to the measuring system through the pressure port, the pressure causes the Bourdon tube to straighten itself, thus causing the end piece to move upward (or downward for vacuum measurements). The movement of the end piece is transmitted via the link to the movement. The movement converts the linear motion of the Bourdon tube end piece to a rotational movement which in turn causes the pointer to indicate the measured pressure.

Bourdon tube pressure gauges are designed for the measurement of pressure and vacuum and are generally suitable for all clean and non-clogging liquid and gaseous media.

Various types of Bourdon tubes are used. C-shape Bourdon tubes are typically used for ranges to 1,000 psi. Higher ranges use coiled Bourdon tubes for safety.

Bourdon tube pressure gauges are available to measure full vacuums, compound and pressure ranges from 0-10 psi to 0-20,000 psi with an accuracy from ±0.25% to ±3/2/3% of span (ASME Grade 3A to Grade B).

HOW THE DIAPHRAGM GAUGE WORKS



Diaphragm gauges are sensitive instruments used in low pressure applications not exceeding 10 psi. The diaphragm capsule is an elastic metal sensing element comprised of two thin wall diaphragms whose sides are soldered together to make the capsule.

Whenever air or gas enters the intake port (gauge connection), it travels into the diaphragm capsule. As vacuum or pressure is applied to the diaphragm capsule, the walls of the capsule expand and contract in response to the change in pressure. This change is then transferred to a rotating rod and arm that rest on the outside of the capsule. The rotating rod is connected to a geared movement through a linkage system. Connected to a shaft, this system then drives the pointer over a dial marked in appropriate pressure or vacuum units.

CHEMICAL COMPATIBILITY TABLE

The media being measured must be compatible with the wetted parts of the pressure instrument. To use the chart below, locate the media whose pressure is to be measured and select a suitable material from those available. This is a simplified chart and assumes the media temperature is 200ºF except for media with a "*" which must be below 100ºF, Throttling devices and/or a liquid-filled instrument are recommended in applications with pulsation or vibration. These recommendations are only a guide, as service life is dependent on temperature, concentrations, catalysts that may be added, or other conditions beyond our control. Consult factory for specific applications and for any services not listed.

1. Bronze and 316 Stainless Steel are acceptable for oxygen service, provided the instrument has been-cleaned for service and is free from oil.
2. Over 1000 psi – entire system must be 316 Stainless Steel.

*Media temperature must be below 100ºF

**Any standard bourdon tube or material may be used in conjunction with a diaphragm seal the gauge selection should be taken into consideration the corrosive environment in which it is to operate.

To use this chart:
1. Find the column with the units you want to convert from
2. Move down that column until you find the "1"
3. Staying in the same row, move horizontally to the column with the units you are converting to
4. Multiply the number in that box by the amount you are changing from to get the converted value

PART NUMBER PREFIX GUIDE

Marsh Instrument part numbers begin with a letter prefix which helps identify the product

PREFIX	PRODUCT TYPE	SEE PAGES
D	Test Gauges	30
D	Inspector's Test Gauges	33
G	Diaphragm Gauges	38
G	Water Test Gauges	49
H	Quality Gauges	28
H	100mm Stainless Steel (L.F.)	22
HW	100mm Welded Socket	25
J	General Service Gauges	12
J	63mm Severe Service Gauges (L.F.)	17
L	Bimetal Thermometers	58
P	Process Gauges	34
W	100mm Elite Gauges (L.F.)	27
W	HVAC/R (Heating System, Contractor's, Refrigeration Ammonia, Manifold)	41-47
W	Paper Machine, X-Tree, Sprinkler	50, 51, 48
X	100mm Severe Service Gauges (L.F.)	19
Y	Tridicators, Industrial Thermometers	63, 61
M	40mm & 50mm Severe Service	16
GG	Marshalltown Value Series	11

PART NUMBER SUFFIX GUIDE

Marsh Instruments part numbers end with a letter suffix to denote a special feature or options.

SUFFIX	OPTION	DESCRIPTION
A	Ring Options	Friction-Black (FB)
		Press-Black (PB)
		Press-Chrome (PC)
		Friction Chrome (FC)
B	Accuracy	ASME Grade 2A 0.5% (H%F);
		ASME Grade 1A, 1.0% (1%F);
		ASME Grade A 2-1-2% (1%H)
D	Oxygen Cleaned	
E	Single Scale psi only Dial	
F	Window Options	Safety Glass (SG)
		Acrylic (AY)
		Instrument Glass (GS)
G	Weatherproof case	
H	Restrictors	
I	Fill Options	Silicone (SL)
		Glycerine (GL)
J	Case Options	Phenolic (PH); Brass (BR)
		Chrome (CR); Stainless Steel (SS)
		Polypropylene Turret (TR)
L	Metric Dial	L1 -Bar Only
		L2-kg/cm^2 Only
		L3-kPa Only
		L4-MPa only
M	Custom Name on Dial or Service Printing	
P	Liquid Filled product	
R	Front Flange	
W	Dual Scale	W1 -psi & Bar
		W2-psi & kg/cm^2
		W3-psi & kPa
		W4-psi & MPa
Z	Pointers	Adjustable Pointers (AD)
		Max. Hand Assembly (MX)

NOTE: Not all options are available on all products, please consult factory

ABBREVIATIONS AND TERMS USED

p or psi	Pounds per square inch
kPa	kilopascals
Case	The case style
oz/in^2	Ounces per square inch
H_2O	Inches of water
ft. H_2O	Feet of water
Hg	Inches of mercury
VAC	Range is in vacuum
NOTE: Compound Ranges, where the gauge measures both vacuum and pressure are designated as: 30" Hg VAC to 100p = measures from 30 inches of mercury vacuum to 100psi pressure.	
P	plain case (no flange or clamps)
F	front flange case (with U-clamp)
R	3 holed front flange (no clamp)
G	back flange case
H	hinged ring case (front flange case with U-clamp and removable cover)
UC	U-clamp case
CONNECTION : The process connection ⅛", ¼", ½" – NPT diameter of connection (National Pipe Thread Standard)	
LM	lower mount
LBM	lower back mount
CB	center back mount
REGISTERED TRADEMARKS: Viton®, Teflon®, & Delrin® are registered trademarks of the E.I. Dupont family of companies.

MARSH BELLOFRAM TERMS & CONDITIONS

I. GENERAL

A. Customer purchase orders are binding only after written acceptance by Marsh Bellofram. Verbal orders shall not be accepted as binding until confirmed in writing by Marsh Bellofram.

B. Prices are effective from date of publication and are subject to change without notice.

C. Marsh Bellofram reserves the right, without prior notice to:

1. Change and/or revoke any price.
2. Change and /or revoke any provisions contained herein.
3. Discontinue shipments to any customers.
4. Resolve any inconsistencies, conflicts or ambiguities.

D. Special production runs or product orders are subject to Marsh Bellofram requirements such as, but not limited to, minimum quantities and extended delivery times. On special production run products Marsh Bellofram reserves the right to over ship or under ship the purchase order quantity by up to 5% and invoice accordingly. Special orders are subject to cancellation charges.

E. Minimum billing: $60 net per order.

II. PAYMENT TERMS

A. For customer with established credit terms: Net 30 days from shipment date.

B. If credit is not established, payment plus estimated (By Marsh Bellofram) freight charges shall accompany order or arrangements shall be made for collect on delivery (C.O.D.)

C. Marsh Bellofram reserves the right to revoke any credit extended to a customer if the customer fails to pay for any shipments when due. If in Marsh Bellofram's opinion there is a material adverse chance in customer's financial condition, Marsh Bellofram shall have the right to suspend further shipments until receipt of adequate assurance of customer's ability to pay therefor.

D. All shipments are F.O.B. Plant of Manufacture.

E. The shipment is deemed accepted in good condition by the common carrier and title and all risk of loss or damage is transferred to customer upon that acceptance by the carrier. The customer is responsible for inspection the merchandise upon receipt. The customer shall insist that visible damage be noted on its copy of the freight bill. If the product has been lost or damaged in transit, the customer must file the claim with the carrier, as Marsh Bellofram bears no responsibility for any such loss or damage.

F. All freight, handling and insurance charges shall be invoiced to the customer or shipped freight collect.

G. All shipments are made by carriers of Marsh Bellofram's choice. Any special arrangements requested by customer shall be at customer's additional expense.

H. Any quantity shortages, incorrect items, or billing errors shall be reported in writing to Marsh Bellofram within 15 days of delivery. Sales order and invoice numbers are to be furnished on all claims.

I. Marsh Bellofram reserves the right to make delivery in installments. All such installments shall be separately invoiced and paid for when due, without regard to subsequent deliveries. Delay in delivery of any installment shall not relieve customer of his obligation to accept remaining deliveries.

J. Marsh Bellofram shall not be liable for failure to deliver or delay in delivery occasioned by causes beyond Marsh Bellofram's control, including without limitation, lockouts, fires, embargoes, war or other breakouts of hostilities, act of inability to obtain shipping space, machinery breakdowns, delays of suppliers, and domestic or foreign governmental acts or regulations. In the event of any delay in delivery due to such causes, unless otherwise agreed, time of delivery shall be deemed extended for a period of sixty (60) days. Customer shall extend the letter of credit if payment is to be made by letter of credit. If delivery is not made within such extended sixty (60) day period, contract shall be deemed cancelled without liability to either party.

III. CANCELED ORDERS

ORDER CANCELLATIONS CAN ONLY BE ACCEPTED BY WRITTEN REQUEST via FAX or MAIL.

All order cancellations result in a cancellation fee of at least 25% of the appropriate invoice of the finished item. Additional cancellation fees are:

1. Catalog Stock Items
   - If cancelled less than 1 week before ship date, 25% cancellation fee.
2. Catalog Non-Stock Items
   - If cancelled less than 30 days before ship date, full price.
3. Customer Specials
   - If cancelled at any time, full price.

IV. LIMITED WARRANTY

A. All Marsh Bellofram products are warranted against defects in workmanship materials under normal use for 1 year after date of purchase from Marsh Bellofram unless otherwise stated. (Proof of purchase is required). Any product which is determined by Marsh Bellofram to be defective in material or workmanship and returned to Marsh Bellofram, shipping costs prepaid, shall be, as the sole remedy, repaired or replaced at Marsh Bellofram's option.

B. This warranty is expressly in lieu of all other warranties expressed or implied, including the warranties of merchantability and fitness for use and all other obligations or liabilities on the part of Marsh Bellofram, and Marsh Bellofram neither assumes nor authorizes any other person to assume for it, and other liability in connection with the sale hereunder. Marsh Bellofram disclaims any liability for product defects that are due to product misuse, improper product selection or misapplication.

C. Marsh Bellofram shall not be liable for customer's costs, lost profits, good will or other special or consequential damages Marsh Bellofram's liability in all events is limited and shall not exceed, the value of merchandise involved.

D. Remedies - Any controversy or claim arising out of or relating to the contract, or the breach thereof, shall be settled by arbitration in Hancock County, State of West Virginia in accordance with the commercial arbitration Rule of the American Arbitration Association, and judgement on the award render by the arbitrator(s) may be entered in a court having jurisdiction thereof.

V. MODIFICATION OF TERMS

This contract constitutes the entire agreement between the parties, all private representations and understanding having been merged herein. It may not be modified or terminated except in writing signed by a duly authorized representative of Marsh Bellofram. This contract shall be governed by and construed according to the laws of the State of West Virginia.

DISTRIBUTOR RETURN POLICY FOR PRESSURE GAUGES & ACCESSORIES

I. RETURN GOODS AUTHORIZATION (RGA)

A. Merchandise returned to Marsh Bellofram for any reason must have a Marsh Bellofram Returned Goods Authorization (RGA) number. Warranty returns also require proof of purchase (invoice number, date, and an RGA number).

B. An RGA is valid for 45 days from issuance and merchandise must arrive at Marsh Bellofram within that validity period.

C. All material must be shipped freight prepaid.

D. The RGA number must be clearly visible on the outside of the package. A packing list must be included which clearly shows the RGA number, quantity, product description and reason for return.

E. No returns will be accepted without an authorized RGA (Return Goods Authorization)

II. MARSH BELLOFRAM CANNOT BE HELD RESPONSIBLE FOR ANY MERCHANDISE RETURNED WITHOUT AN RGA NUMBER.

A. An RGA number is issued in good faith based upon customer's representation of the merchandise quantity, condition, age and reason for return. All returned material is subject to inspection by Marsh Bellofram. If the material is found to be other than that originally represented, the shipment will be returned at the customer's expense.

B. An RGA may be requested by mail, fax or by telephoning Marsh Bellofram at 304-387-1200.

1. Warranty Returns (see Warranty Policy): Limited in-warranty merchandise must have an RGA number and be returned freight prepaid. The merchandise will be repaired or replaced under Marsh Bellofram's warranty terms, it will be returned freight prepaid to the customer.
2. Incorrect Shipments: For short shipments or incorrectly supplied merchandise, discrepancies must be reported within 15 days of receipt. For short shipments, a debit memo should be issued to Marsh Bellofram. Marsh Bellofram will then issue a credit memo, ship the missing merchandise freight prepaid and issue an invoice. For incorrectly supplied merchandise, all returns require an RGA number and must be returned freight prepaid. A debit memo should be issued to Marsh Bellofram for the freight. If a replacement is required, Marsh Bellofram will ship freight prepaid and invoice for the new product plus freight.
3. General Terms for Returns (Exchange or Credit): Material requested to be returned will be considered if the following conditions are met:
   a. Merchandise is unused, current standard catalog stock of latest design, with both product and packaging in saleable condition.
   b. Merchandise shall have been purchased directly from Marsh Bellofram in the last 12 months.
   c. Merchandise shall not have been purchased on a "product promotion" or other special pricing.
4. Marsh Bellofram reserves the right to reject any return request. If accepted, the return will be under the terms specified herein. The following products are not returnable:

   a. Annual Merchandise Exchange Policy for Marsh Bellofram Distributors: Marsh Bellofram will normally accept one stock exchange in a 12 month period, for the purpose of increasing the flexibility of distributor's stock This annual exchange is limited to distributors who are in good standing and whose accounts are current. The merchandise is subject to the product restrictions listed previously and limited to no more than 2% of the net invoiced sales from Marsh Bellofram to the distributor location during the previous 12 months. The value of the exchange will be determined by the current list price and current maximum published discount.

      <u>An offsetting order equal to the return is required.</u>

      1. The distributor shall issue a written request for an RGA number for the annual exchange showing quantity, product catalog number and description.
      2. The exchange is subject to Marsh Bellofram approval and may be subject to an on-site inspection by Marsh Bellofram personnel. Please allow minimum 2 weeks for approval. Non-stock product or custom product is not returnable.
      3. Upon approval of the exchange, Marsh Bellofram will inform the distributor of the net amount of the exchange for the scheduled date for return. The RGA number will be issued only upon receipt of a purchase order for an equal (net) value, calculated on current list price, current maximum published discount.
      4. Upon receipt of RGA number, the distributor shall then package the authorized material and return freight prepaid to Marsh Bellofram, Newell, WV. The distributors bears liability for lost shipments or shipping damage.
      5. All merchandise is subject to inspection upon receipt. Merchandise which is found to be damaged, modified, or in any other way ineligible for exchange, will be returned at the customer's expense and the value will be deducted from the exchange. A credit memo will then be issued for the net value of the exchange.
      6. The replacement order will be shipped and invoiced against the new purchase order with freight at distributor's expense.

   b. Merchandise Returns for Credit: Merchandise returned for credit requires an RGA number, and is subject to a 25% restocking charge and must be returned freight prepaid. The amount of the credit will be determined as follows:

      1. Items returned within 90 days of purchase and with proof of purchase (copy of invoice) will be at invoiced price less applicable charges.
      2. All other will be calculated at current list price and current maximum published discount less 25% restocking fee.
      3. In addition to the standard restocking fee, gauges with accessories will be subject to a removal charge equal to the difference between the "installed" and "sold separately" prices.
      4. Solid fill thermometry products are non-returnable.

   c. Credit Memos:

      1. Where required, Marsh Bellofram will issue a credit memo for the returned or exchanged merchandise less any applicable restocking or removal charges.
      2. The credit memo will be issued only after receipt and inspection of merchandise.
      3. Deduction from payments shall not be made until the Marsh Bellofram issued credit memo has been received.

PRODUCT CLASSES AND OPTIONS

A. Stock items: Shipped in 7 days or less, with no minimum quantity. *(Large quantities may require extended lead times.)*

B. Non-stock items: Consult factory for quantities and lead times.

C. Custom options on stock items: Dials, rings, windows, restrictors, and cosmetic changes - 4 weeks.

E. Customer special class: Special connections and materials consult factory for quantities and lead times.

PRODUCT WARNINGS, CLAIMS, RECOMMENDATIONS AND NOTICES

WARNING: A failure resulting in injury or damage may be caused by pressure beyond top of scale, excessive vibration or pressure pulsation, excessive instrument temperature, corrosion of the pressure containing parts, or other misuse. For correct use and application of pressure gauges, refer to ASME standard B40.1 1998, entitled 'Gauges: Pressure Indicating Type: Elastic Element.' This document is available from The American Society of Mechanical Engineers, United Engineering Center, 345 East 47th Street, New York, NY 10007.

WARNING: LIQUID FILL: Glycerine or Silicone when combined with strong oxidizing agents, including but not limited to chlorine, nitric acid, and hydrogen peroxide, can result in a spontaneous chemical reaction, ignition, or explosion which can cause property damage and personal injury. If gauges are to be used in such service, do not use glycerine or silicone fill. Consult factory for proper fill medium.

IMPORTANT NOTICE: Our recommendations, if any, for the use of these products are believed to be reliable. The greatest care is exercised in the selection of our raw materials and in our manufacturing operations. However, since the use of this product is beyond the control of the manufacturer, no guarantee or warranty, express or implied, is made to such use or effects incidental to such use, handling or possession or the results to be obtained whether in accordance with the directions claimed so to be. The manufacturer expressly disclaims responsibility therefor. Furthermore, nothing contained herein shall be construed as a recommendation to use any product in conflict with existing laws and/or patents covering any material or use.

LIMITED WARRANTY:

(1) All Marsh Instruments products are warranted against defects in workmanship or materials under normal use for one year after date of purchase from Marsh Instruments unless otherwise stated. (Proof of purchase is required). Any product which is determined by Marsh Instruments to be defective in material or workmanship and is returned to Marsh Instruments with shipping costs prepaid, shall be, as the sole remedy, repaired or replaced at Marsh Instruments' option.

(2) THIS WARRANTY IS EXPRESSLY IN LIEU OF ALL OTHER WARRANTIES EXPRESSED OR IMPLIED, INCLUDING THE WARRANTIES OF MERCHANTABILITY AND FITNESS FOR USE AND OF ALL OTHER OBLIGATIONS OR LIABILITIES ON THE PART OF MARSH INSTRUMENTS, AND MARSH INSTRUMENTS NEITHER ASSUMES NOR AUTHORIZES ANY OTHER PERSON TO ASSUME FOR IT ANY OTHER LIABILITY IN CONNECTION WITH THE SALE HEREUNDER. MARSH INSTRUMENTS DISCLAIMS ANY LIABILITY FOR PRODUCT DEFECTS THAT ARE DUE TO PRODUCT MISUSE, IMPROPER PRODUCT SELECTION OR MISAPPLICATION.

(3) Marsh Instruments shall not be liable for customer's costs, lost profits, good will or other special or consequential damages incurred in any way. Marsh Instruments' liability in all events is limited to, and shall not exceed, the value of merchandise involved.

NOTE: ALL MARSH INSTRUMENT PRODUCTS ARE SUBJECT TO CONTINUOUS IMPROVEMENT. THEREFORE, MATERIAL AND SPECIFICATIONS ARE SUBJECT TO CHANGE WITHOUT NOTICE.

Martin

SPROCKET & GEAR, INC.

MAINTENANCE & TROUBLESHOOTING GUIDE

WARNING & SAFETY REMINDER

Safety must be considered a basic factor in machinery operation at all times. **Most accidents are the results of carelessness or negligence**. All rotating power transmission products are potentially dangerous and must be guarded by the contractor, installer, purchaser, owner, and user as required by applicable laws, regulations, standards, and good safety practice. Additional specific information must be obtained from other sources including the latest editions of American Society of Mechanical Engineers; Standard A.N.S.I. B15.1. A copy of this standard may be obtained from the American Society of Mechanical Engineers at 345 East 47th Street New York, NY 10017 (212705-7722).

It is the responsibility of the contractor, installer, purchaser, owner, and user to install, maintain, and operate the parts or components manufactured and supplied by Martin Sprocket & Gear, Inc., in such a manner as to comply with the Williams-Steiger Occupational Safety Act and with all state and local laws, ordinances, regulations, and the American National Standard Institute Safety Code.

CAUTION

Guards, access doors, and covers must be securely fastened before operating any equipment.

If parts are to be inspected, cleaned, observed, or general maintenance performed, **the motor driving the part or components is to be locked out electrically in such a manner that it cannot be started by anyone,** however remote from the area. Failure to follow these instructions may result in personal injury or property damage.

WARNING

NOTE: CATALOG DIMENSIONS

Every effort is made to keep all catalog dimensions and styles current; however, from time to time, it is necessary because of manufacturing changes to alter stock products dimensionally.

If any stock product dimension or style shown in this catalog is critical to your application please consult factory for certification.

CHAIN DRIVES

Type Maintenance	What To Do
Lubrication — Type A	Manual Lubrication, oil applied periodically brush or spout can. Drip lubrication, oil applied between link plates edges from a drip lubricator.
Lubrication — Type B	Oil bath or oil slinger, oil level maintained in casing at predetermined height.
Lubrication — Type C	Oil stream, oil supplied by circulating pump inside chain loop on lower span.
Check for Chain Stretch	If elongation is in excess of 3%, replace with new chain. Check length after first 1,000 hours.
Check Sprocket	If teeth have a hooked appearance, replace. Initial inspection 24 hours, second 100 hours, third 500 hours. Periodically thereafter, check chain length, may be elongated.
Check Alignment	If wear is apparent on inner surface of roller link side-bars and on sides of sprocket teeth, there is misalignment. Realign sprockets.

Troubleshooting	Corrective Action
Broken Sprocket Teeth	If cast iron, replace with Martin stock steel sprockets (available hardened in pinion sizes). Reduce shock load or redesign and replace with a larger drive. Correct any misalignment. Replace sprocket, might be excessively hardened. Should be RC40-50.
Wear on Sprockets or Rollers Nonsymmetrical	Realigning nonparallel shafts or shafts not in same plane. Shafts might be bent, or shaft bearings worn.
Wear on Side of Sprocket Teeth or Inside of Roller Plates	Sprockets are offset or not parallel and should be realigned.
Wear on Tips of Sprocket Teeth	Chain elongation is excessive and chain should be replaced.
Chain Climbs Sprocket	Chain does not properly fit sprocket. Check sprocket bottom diameters and replace if necessary. Chain may be stretched more than 3%. If sprocket worn, replace chain and sprocket or replace chain if worn. Redesign drive for more teeth in contact if insufficient chain wrap. Or use Martin chain tighteners. Should have at least 17 teeth in small sprocket. Provide cover for chain drive when material builds up in the tooth pocket of the sprocket. Or "mud reliefs" may be helpful.
Excessive Noise	Check sprocket alignment. Lubricate chain and sprocket drive. Replace chain and/or sprocket(s) if worn. Driver should have hardened teeth. Tighten and align supports, casing, and chain when moving parts contact stationary parts.
Excessive Link Plate Wear and/or Sides of Sprocket Teeth	Realign drive.
Excessive Vibration	Possible broken or missing roller. Replace or repair chain. Check shaft bearing supports, bearings may be worn or broken.

GEAR DRIVES

Type Maintenance	What To Do
Proper Lubrication	As recommended by your lubrication supplier, contact for details.
Inspect for Wear and Alignment	Initial inspection 24 hours, second 100 hours, third 500 hours. Once a year thereafter. Check tooth contact pattern for full face contact.

Troubleshooting	Corrective Action
Excessive Gear Wear	Check H.P. requirement for possible replacement with hardened gears of same size. Or replace with gears having greater face width. See Martin Catalog - Gear Section. Possible redesign of drive with more capacity. Check Martin Catalog - Gear Section. Check environmental abrasiveness, provide cover as needed with replacement of hardened gears. Check for proper lubrication.
Excessive Drive Noise	Check gear set for proper backlash. Adjust as necessary. Misaligned drive. Worn gears, replace as necessary. Drive speed too high, check pitch line velocity.
Gear Breakage	Eliminate overload or shock load conditions. Replace drive with wider gears or 20° P.A. gears. Provide adequate cover for environmental material surrounding drive.
Disfiguration of Gear Tooth	Remove overload condition. Replace with hardened gears or wider gears.

CHAIN COUPLINGS

Type Maintenance	What To Do
Lubrication	Check after initial 100 hours for leakage. Change lubricant once per year thereafter.
Check Alignment	Disassemble after initial 100 hours, check for excessive wear. If misaligned, wear patterns will appear very uneven. If necessary, realign shafts and replace worn coupling parts.

Troubleshooting	Corrective Action
Premature Chain Wear	Provide adequate lubrication, provide with sealed cover for longer life. Check for excessive radial misalignment and/or excessive end float. Realign shafts to eliminate most of misalignment. Check for sudden shock loads. If they are present then it may be necessary to change from chain couplings to more flexible type couplings such as Martin "Q.D." Flex or Quadra-Flex.
Chain Breakage	Provide adequate lubrication, provide with sealed cover for longer life. Check for excessive radial misalignment and/or excessive end float. Realign shafts to eliminate most of misalignment. If not provided with cover, check for foreign objects near or in coupling, provide with cover. Check for sudden shock loads, if present go to larger coupling or go to more flexible type couplings such as Martin "Q.D." Flex or Quadra-Flex.
Excessive Noise	Check chain and sprockets to make sure not worn, or have broken pin link. Replace if necessary, chain may be striking inside of cover.

JAW COUPLINGS

Type Maintenance	What To Do
Jaw Breakage	Buna-N Insert failed causing metal to metal contact. Replace with hytrel or urethane spiders. Hytrel withstands oil products better than urethane or Buna-N. Hytrel will not withstand hot water. Urethane withstands water better. Eliminate overload or shock load conditions. Replace drive with new MS jaw coupling. Carries approximately 20% higher capacity.
Rubber Element Failure	Buna-N insert failed due to horsepower applied to coupling greater than insert can withstand. Replace with Hytrel spider, which can withstand 3 times Buna-N horsepower capacity. Check misalignment. Coupling can only handle up to 1° angular misalignment.
Excessive Drive Noise	Check jaw set for proper fit. May have wrong insert in coupling. Misaligned drive. Worn couplings, replace as necessary. Drive speed too high, check shaft rpm.

QUADRA-FLEX COUPLINGS

Type Maintenance	What To Do
Element Failure	Check for alignment. Can handle up to 1° angular and up to .062 parallel offset misalignment. Check for proper installation. May be installed in an application not suited for the coupling; i.e., an internal combustion engine, reciprocating pump, compressor, or fan and propeller blades.
Teeth Worn on One or Both Sides of Sleeve	Caused by excessive misalignment. Realign coupling. Improper service factor. Check design, go to larger coupling.
Sleeve Ruptured	Caused by shock loads. Use a larger coupling. Critical speed. Check for excessive vibrations.
Wire Ring Comes Loose	Caused by overload. Use a larger coupling.
Excessive Compression Set or Permanent Wind-up	Caused by overload. Use a larger coupling.
Crack in Sleeve at 45°	Caused by flex fatigue. Normal mode of failure, if premature use a larger coupling.
Sleeve Thrown Out of Coupling	Caused by shock load. Unjam machine, check for misalignment. Caused by overspeed. Reduce speed of coupling.
Element Deteration	TPR (Thermo-Plastic Rubber) can operate in conditions of extreme temperatures -50°F to +250°F and in oily or wet conditions. Neoprene can operate in temperatures of 0°F to +250°F. Hytrel can operate in temperatures of -65°F to +250°F and oily conditions. Hytrel will not withstand hot water. If elements are deteriorating due to heat or solvents check sleeve chemical resistance from table in Martin catalog #1090 page C8.

Type of Failure	Probable Cause	Corrective Action
Excessive Edge Wear (Exposed Tensile Member)	Misalignment or nonrigid centers.	Check alignment and/or reinforce mounting.
	Bent flange.	Straighten flange.
Jacket Wear on Pressure-Face Side of Belt Tooth	Excessive overload and/or excessive belt tightness.	Reduce installation tension and/or increase drive load-carrying capacity.
Excessive Jacket Wear Between Belt Teeth (Exposed Tension Members)	Excessive installation tension.	Reduce installation tension.
Cracks in Neoprene Backing	Exposure to excessive low temperature (below 30°F).	Eliminate low temperature condition or consult factory for proper belt construction.
Softening of Neoprene Backing	Exposure to excessive heat (+200°F) and/or oil.	Eliminate high temperature and oil condition or consult factory for proper belt construction.
Tensile or Tooth Shear Failure	Small or sub-minimum diameter pulley.	Increase pulley diameter of use next smaller pitch with same P.D.
Indicating Corrosion of Tension Member (rust)	Extreme humidity.	Eliminate humidity or refer to factory for belt construction.
	Acid or caustic atmosphere.	Refer to factory for belt construction.
Excessive Pulley Tooth Wear (On Pressure-Face and/or O.D.)	Excessive overload and/or excessive belt tightness.	Reduce installation tension and/or increase drive load-carrying capacity.
	Insufficient hardness of pulley material.	Surface-harden pulley or use harder material.
Unmounting of Flange	Incorrect flange installation.	Reinstall flange correctly.
	Misalignment.	Correct alignment.
Excessive Drive Noise	Misalignment.	Correct alignment.
	Excessive installation tension.	Reduce tension.
	Excessive load.	Increase drive load-carrying capacity.
	Sub-minimum pulley diameter.	Increase pulley diameter.
Tooth Shear	Less than 6 teeth in mesh (TIM).	Increase TIM or use next smaller pitch with same P.D.
	Excessive load.	Increase drive load-carrying capacity.
Apparent Belt Stretch	Reduction of center distance or nonrigid mounting.	Retension drive and/or reinforce mounting.
Cracks or Premature Wear at Belt Tooth Root	Improper pulley groove top radius.	Regroove or install new pulleys.
Tensile Break	Excessive load.	Increase load-carrying capacity of drive.
	Sub-minimum diameter.	Increase pulley diameters.

Note: When HP rating is adequate, using multiple belts in matched sets rather than a single wide belt will reduce sound emission. Effective noise reduction for power transmission drives can be accomplished by incorporating a flexible noise-absorbing material such as acoustical-grade glass fiber with the protective guard. The guard design must allow a cooling air passage on the top and bottom to prevent overheating the drive.

SYNCHRONOUS DRIVES
TIMING BELT DRIVES

Type of Failure	Probable Cause	Corrective Action
Teeth Wearing Unevenly	Shafts might not be parallel causing belt to pull one side. Abrasion material may be on teeth or enmeshed into belt.	Check alignment of shafts.
Belt Breakage	Improper sized for torque loading.	Check proper sizing procedures.
	Too much load.	May be severe shock load, may need to go to chain drive instead of belt drives.
	Underdesigned drive.	Redesign drive.
	Sharp bend damaged tensile cord.	Follow proper storage and handling procedures.
	Belt was pried or forced on the drive.	Follow proper installation procedures.
	Foreign object in drive.	Shield drive.
	Belt runs onto pulley flange.	Align pulleys.
Apparent Belt Stretch	Reduction of center distance or nonrigid mounting.	Retension drive and/or reinforce mounting.
	Pulley teeth poorly machined or worn.	Replace pulleys. Install cover if drive is dusty.
	Sudden equipment stops.	Increase deceleration time or redesign drive.
	Belt does not engage pulley teeth.	Retension drive.
Tooth Shear	Less than 6 teeth in mesh.	Redesign drive, install back side idler, or use next smaller pitch.
	Excessive load.	Redesign drive.
Tensile or Tooth Shear Failure	Pulley diameter too small.	Increase pulley diameter or use next smaller pitch.
	Exposure to acid or caustic atmosphere.	Protect drive or ask Martin about special construction belt.
Excessive Pulley Tooth Wear (On Pressure Face and/or O.D.)	Drive overload and/or excess belt tension.	Reduce installation tension and/or increase drive load carrying capacity.
	Insufficient hardness of pulley material.	Use harder material or surface-hardened pulley.
Excessive Jacket Wear Between Teeth, Exposed Tensile Cord	Excessive installation tension.	Reduce installation tension.
Excessive Noise	Misalignment.	Realign drive.
	Excessive installation tension.	Reduce tension.
	Excessive load.	Increase drive load carrying capacity.
	Pulley diameter too small.	Increase pulley diameter.
Cracks in Belt Backing	High temperatures.	Improve ventilation, remove heat source, or check with Martin for special construction belt.
Softening of Backing	Excess heat (over 200°F) and/or oil.	Lower ambient temperature, protect from oil, or ask Martin about special belt construction.
Excessive Edge Wear	Misalignment or nonrigid centers.	Realign drive and/or reinforce mounting.
	Bent flange.	Straighten flange.
Unmounting of Flange or Flange Wear	Incorrect flange installation.	Install flange correctly.
	Misalignment.	Realign drive.

V-BELT DRIVES

Type of Failure	Probable Cause	Corrective Action
V-BELTS — Short Belt Life		
Rapid Failure With No Visible Reason	Worn sheave grooves (Use groove gauge to check).	Replace sheaves.
	Tensile cord damage through improper installation.	Replace all belts with a new set, check for proper installation.
	Drive is underdesigned.	Redesign drive.
	Wrong type or cross section belt.	Replace all belts with correct type, check for proper installation.
	Sheave diameter too small.	Redesign drive.
	Foreign substance caught between belts and sheave.	Shield the drive with drive guard.
Soft, Sticky, Swollen Sidewalls Low Adhesion Between Plies	Oil or grease on belt or sheave.	Clean belts and sheave with degreasing agent or detergent and water. Remove source of oil or grease.
Dry, Hard Sidewalls. Use Low Adhesion Between Plies. Cracked Belt Bottom	Excessive high temperature.	Remove heat source. Improve ventilation.
Deteration of Rubber	Belt dressing being used.	Don't use belt dressing. Clean belts and sheaves with degreasing agent or detergent and water. Tension belts properly.
Rapid Sidewall Wear	Worn or damaged sheaves.	Replace sheaves.
Broken Belts	Foreign object in drive.	Shield drive with drive guard.
Spin Burns	Belts slip under starting or stalling load.	Check belt tension — retension drive if necessary.
	Sheave diameter too small.	Redesign drive.
	Load miscalculated — drive underdesigned.	Redesign drive.
Cut Bottom	Improper installation.	Replace all belts with a new set, check for properly installation.
	Foreign object in drive.	Shield drive with drive guard.
	Belt was run off sheave.	Check for proper tension and alignment.
Cracked Bottom	Excessive high temperature.	Remove heat source. Improve ventilation.
	Back side idler too small.	Replace with an inside idler on slack side, or redesign.
	Sheave diameter too small.	Redesign drive. Use cogged belts.
	Slippage.	Retension drive.
Extreme Cover Wear, Worn Corners	Sheaves rusted, sharp corners or burrs on sheaves.	Repair or replace sheaves.
	Dirt on belt.	Clean belt, shield drive.
	Sheaves misaligned.	Realign sheaves.
	Belts rub against guard or other obstruction.	Remove obstruction or check drive alignment.
	Improper tension.	Retension drive.

V-BELTS — Short Belt Life

Type of Failure	Probable Cause	Corrective Action
Belts Stretch		
Belts Stretch Equally	Overloaded or under-designed drive.	Redesign drive.
	Insufficient take-up allowance.	Check take-up and follow guidelines.
Belts Stretch Unequally	Tensile cord broken from improper installation.	Replace all belts with a new set, check for proper installation.
	Misaligned drive.	Realign drive.
Belt Turnover	Misaligned sheaves.	Realign sheaves.
	Belt undertensioned.	Retension drive.
	Severe vibration and shock loads.	Use Combo belts.
	Incorrectly placed flat pulley.	Position idler on slack side of drive, as close as possible to driveR sheave.
	Worn sheave grooves (Use groove gauge to check).	Replace sheaves.
	Foreign material in grooves.	Shield drive with drive guard.
	Tensile cord broken from improper installation.	Replace all belts with a new set, check for proper installation.
Belt Noise	Belt slip.	Retension.
	Misaligned sheaves.	Realign sheaves.
	Wrong belt type.	Replace cut edge with wrapped belt.
Belt Vibration	Shock loads.	Use Banded or Combo belts.
	Incorrectly placed flat idler pulley.	Position idler on slack side of drive, as close as possible to driveR sheave.
	Distance between shafts too long.	Install idler.
	Belt lengths uneven.	Replace all belts with a new matched set.
	Belt too loose.	Retension drive.
Severe Slippage	Spin burns.	Retension drive.
	Too few belts.	Redesign drive.
	Arc of contact too small.	Install back side idler on slack side, or use timing belt.
	Oil or water on belt.	Clean belts and sheave, shield drive with drive guard.
Installation Problems		
Belts Too Long or Short at Installation	Design and/or belt selection error.	Check catalog for proper design and selection.
Belts Mismatched at Installation	Worn sheave grooves.	Replace sheaves.
	Mixed used and new belts.	Replace all belts with new belts.
	Mixed belts from different manufacturers.	Replace belts from the same manufacturer.
Hot Bearings		
Drive Overtensioned	Worn sheave grooves, belts bottom out.	Replace sheaves.
Sheave Diameter Too Small	Design error.	Redesign drive.
Sheaves Too Far Out On Shaft	Design error or obstruction.	Place sheaves as close to bearing as possible.
Improper DriveN Speed		
Incorrect DriveR to DriveN Ratio	Design error.	Redesign drive.

SCREW CONVEYOR

Type of Failure	Probable Cause	Corrective Action
SCREW CONVEYOR — Product Failure		
Premature Trough Failure	Gauge too light.	Increase thickness. Consult Martin catalog materials table/component series for recommendation.
	Screw deflection.	Eliminate excessive deflection. Consult Martin catalog for calculation procedure to determine proper pipe size and screw length.
	Bent screw.	Straighten or replace. Check before operation.
Accelerated Flight Tip Wear	Gauge too light.	Increase thickness. Consider hardfacing.
	RPM too high.	Slow conveyor down. Consult Martin catalog engineering section to determine proper trough loading.
Coupling Shaft Breakage	Torque capacity insufficient.	Increase torque capacity or use larger shaft. Check motor amp demand for torque requirements.
Shaft Hole Elongation	Insufficient number of bolts.	Increase number of bolts.
	Conveyor subject to "jogging" or too frequent stop/start, or frequent overloads.	Cease jogging or frequent stop/start or overload. If this is not possible increase bearing capacity of shaft and/or increase number of bolts.
Drive Shaft Breakage	Excessive torque.	Recalculate HP requirements.
	Insufficient torque capacity.	Increase torque capacity.
	Obstruction in conveyor.	Check screw alignment.
Motor/Heaters Overload	Amp. demand excessive for motor.	Recheck horsepower calculations. Check material characteristics. Check capacity. Regulate feed.
Inlet Trough End Bearing Failure	Material getting into bearing.	Add or upgrade seal to keep material out of bearing. Change to outboard bearing.
	Insufficient lubrication.	Lubricate properly.
	Shaft slope.	Align screw. Check for excessive screw deflection and for bent screw.
Discharge Trough End Bearing Failure	Material getting into bearing.	Add or upgrade seal. Change to outboard bearing. Cut off flight at center of discharge.
Hanger Bearing Failure	Incorrect alignment.	Align hanger.
	Heat due to hot material being conveyed.	Use appropriate bearing material.
	Heat due to insufficient lubrication.	Properly lubricate.
	Thrust due to pipe pressing on bearing insert.	Check coupling bolts and holes for elongation and wear. Replace as necessary. Readjust screw/hanger assembly to get proper clearances.
	Improper material causing premature wear.	Consult Martin catalog for proper material due to temperature, trough loading, and speed. Check to ensure coupling shaft material and bearing material are compatible.

Floor Scales

VLC

Industrial Floor Scales

Commercial Duty

Rugged Floor Scales

for Demanding Industrial Applications

METTLER TOLEDO

A Versatile Weighing Solution for All Types of Environments

- **Rugged industrial scales designed to handle forklift traffic**
- **Stainless steel designs meet food industry standards**
- **Adjustable feet for leveling the scale on uneven floors**

Our 2256 VLC floor scales are fully electronic with a low profile that makes them easy to load and unload. They are rugged enough to stand up to tough industrial environments. Optional 304 and 316 stainless steel versions are designed specifically for the harsh, wet environments of the food industry. Capable of withstanding 100% end loading, these floor scales are ideal for handling the forklift traffic and concentrated-load applications that are common to shipping and receiving operations.

For All Environments
No matter what industrial environment you work in, we have a weighing solution. VLC floor scales are available in three types of material:

- Carbon steel painted with a durable, two-part epoxy finish for industrial environments.
- 304 stainless steel for extra protection in washdown and corrosive environments.
- 316 stainless steel for caustic and extreme cleaning applications.

All VLC floor scales are equipped with stainless steel load cells that are hermetically sealed and IP69K stainless steel junction boxes.

For All Applications
VLC floor scales can be installed in a pit, on top of the floor, or used as portable scales. Our Quick-Pit frames ensure a perfectly square pit installation that is flush with the floor. For permanent, top-of-floor installations, locating plates can be used to keep the scale in position. Adjustable feet make it easy to level the scales on uneven floors, simplifying the task of setting them up in a variety of locations. Top-of-floor installations can be equipped with ramps to make them easily accessible from all four sides. Our standard tread-plate surface on mild steel products provides safe footing for workers.

Custom Designs
VLC floor scales are available in a wide range of standard sizes and capacities. Plus, we can engineer and manufacture custom scales to meet your specific requirements. With our design technology and world class manufacturing capabilities, we can deliver the highest quality custom scales to you in the shortest time possible.

Scales are manufactured to strict quality standards in our ISO 9001 certified plant.

Factory Calibration
For the ultimate in quick and easy setup, we can supply your VLC floor scale with a terminal that is wired and calibrated at the factory. This option makes the scale fully operational right out of the box, so that you can set it up and start weighing immediately. Choose from an IND221 terminal for desktop use or a stainless steel IND226 terminal for wall mounting and use in harsh environments.

VLC Accessories

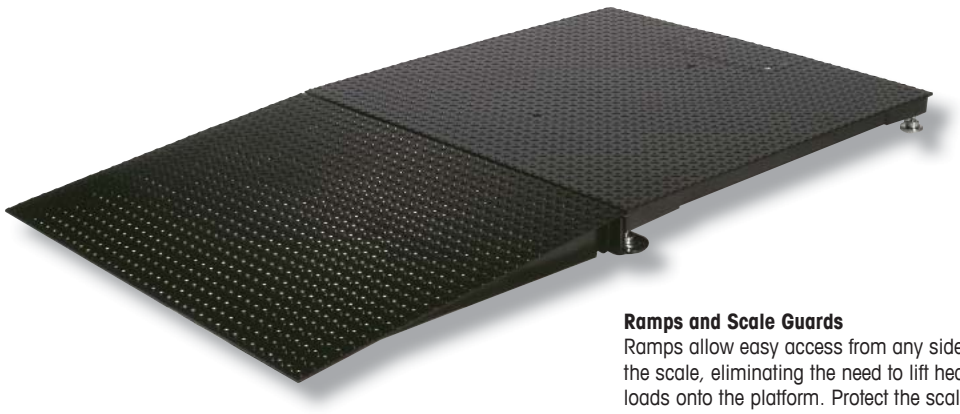
Quick-Pit Frames
Our Quick-Pit frame makes it easy to install a pit scale that is square and flush with the floor. Just level the frame in the rough floor opening and pour concrete. The Quick-Pit frame creates its own form. After the concrete has cured, install the scale.

Mild steel scales are rugged enough for use in tough industrial environments.

Instrument Columns
Instrument columns are available in carbon steel and stainless steel. They are equipped with the bracket required for mounting your scale terminal.

Stainless Steel Pit Liners
Stainless steel pit liners are ideal for hygienic applications where bacteria and cross-contamination are not acceptable. They make pit construction simple and easy.

Stainless steel scales are designed for the food industry's harsh, wet environments.



Ramps and Scale Guards
Ramps allow easy access from any side of the scale, eliminating the need to lift heavy loads onto the platform. Protect the scale from side-impact damage by installing scale guards on sides of the scale that do not have ramps. The angled guards prevent costly damage to scale frames and load cells.

VLC scales are designed for 100% end loading to handle forklift traffic.

Specifications

Standard Platform Size	3x3 to 5x7 ft (914x914 to 1524x2134 mm)
Available Capacities	2500 to 10,000 lb (1000 to 6000 kg)
Platform Height	3.5 in (89 mm)
Construction	Two-part, epoxy-painted mild steel, 304 stainless steel, or 316 stainless steel
Load Cell Type	Hermetically sealed stainless steel, four 350-ohm load cells
Load Cell Suspension	Rocker-foot suspension
Junction Box	Top access, stainless steel IP69K
End Loading	100% end loading
Standard Operating Temp.	14°F to 104°F (-10°C to 40°C)
Metrological Approvals	NTEP, Measurement Canada, OIML
Hazardous Area Approvals	FM, CSA, Ex, ATEX
Shipping Weight	250 to 925 lb (113 to 420 kg)
Compatible METTLER TOLEDO Instruments	Any METTLER TOLEDO terminal

Options

- Ramps: standard or low angle
- Instrument columns
- Foot-locating plates
- Optional load cell cable lengths
- Custom sizes
- Quick-Pit frames
- Stainless steel pit liners
- Scale side guards
- Remote junction box mounting
- Safety tread or smooth deck plate
- Deck finish: electropolish or mechanical polish Ra 35

IP69K junction box for extra protection.

METTLER TOLEDO

Publication Revision History

An overview of this manual's revision history is compiled below.

Publication Name: 2256 VLC WEIGHT-PLATE Analog Floor Scale Installation and Service Manual

Publication Part Number: A14914100A Publication Date: 8/97

Part Number	Date	Revisions
B14914100A	11/98	Added Class III acceptable readability data on page 1-1.
C14914100A	8/02	Revised manual so that it covers the new 2256 VLC design.
D14914100A	8/04	Added information about new leveling foot.
E14914100A	2/08	Added information about Revision 4 version of scale, including new leveling foot, junction box, and 745A load cell with retaining clip.
E14914100A.01	1/10	Removed warranty information. Updated hazardous area and parts information.

INTRODUCTION

This publication is provided solely as a guide for individuals who have received Technical Training in servicing the METTLER TOLEDO product.

Information about METTLER TOLEDO Technical Training can be obtained by writing, calling, or faxing:

FCC Notice

This device complies with Part 15 of the FCC Rules and the Radio Interference Requirements of the Canadian Department of Communications. Operation is subject to the following conditions: (1) this device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at his own expense.

METTLER TOLEDO RESERVES THE RIGHT TO MAKE REFINEMENTS OR CHANGES WITHOUT NOTICE.

Office of Weights and Measures

Original issue: September, 1996

Revised: January, 1999 Added: model 745A, conformity to 89/336/EU – 73/23/EU – 76/117/EEC
May, 2003 added compliance to ATEX Directive 94/9/EC for both Category 2 and 3.

According to EN 45014

Precautions

READ this manual BEFORE operating or servicing this equipment.

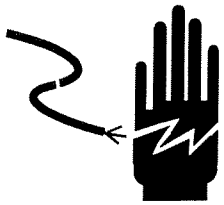
FOLLOW these instructions carefully.

SAVE this manual for future reference.

DO NOT allow untrained personnel to operate, clean, inspect, maintain, service, or tamper with this equipment.

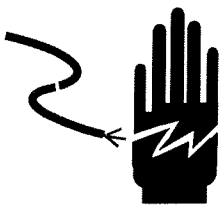
ALWAYS DISCONNECT this equipment from the power source before cleaning or performing maintenance.

CALL METTLER TOLEDO for parts, information, and service.



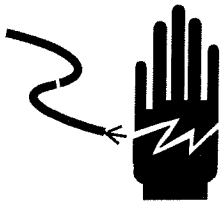
⚠ WARNING

PERMIT ONLY QUALIFIED PERSONNEL TO SERVICE THIS EQUIPMENT. EXERCISE CARE WHEN MAKING CHECKS, TESTS, AND ADJUSTMENTS THAT MUST BE MADE WITH POWER ON. FAILING TO OBSERVE THESE PRECAUTIONS CAN RESULT IN BODILY HARM.



⚠ CAUTION

FOR CONTINUED PROTECTION AGAINST SHOCK HAZARD, CONNECT TO PROPERLY GROUNDED OUTLET ONLY. DO NOT REMOVE THE GROUND PRONG.



⚠ WARNING

DISCONNECT ALL POWER TO THIS UNIT BEFORE INSTALLING, SERVICING, CLEANING, OR REMOVING THE FUSE. FAILURE TO DO SO COULD RESULT IN BODILY HARM AND/OR PROPERTY DAMAGE.

⚠ CAUTION

BEFORE CONNECTING OR DISCONNECTING ANY INTERNAL ELECTRONIC COMPONENTS OR INTERCONNECTING WIRING BETWEEN ELECTRONIC EQUIPMENT, ALWAYS REMOVE POWER AND WAIT AT LEAST THIRTY (30) SECONDS. FAILURE TO OBSERVE THESE PRECAUTIONS COULD RESULT IN BODILY HARM OR DAMAGE TO OR DESTRUCTION OF THE EQUIPMENT.

⚠ CAUTION

OBSERVE PRECAUTIONS FOR HANDLING ELECTROSTATIC SENSITIVE DEVICES.

⚠ WARNING

USE EXTREME CAUTION WHEN LIFTING AND MOVING THE SCALE TO THE DESIRED LOCATION. DO NOT ATTEMPT TO LIFT AND MOVE THE SCALE BY YOURSELF OR INJURY COULD OCCUR.

Disposal of Electrical and Electronic Equipment

In conformance with the European Directive 2002/96 EC on Waste Electrical and Electronic Equipment (WEEE) this device may not be disposed of in domestic waste. This also applies to countries outside the EU, per their specific requirements.

Please dispose of this product in accordance with local regulations at the collecting point specified for electrical and electronic equipment.

If you have any questions, please contact the responsible authority or the distributor from which you purchased this device.

Should this device be passed on to other parties (for private or professional use), the content of this regulation must also be related.

Thank you for your contribution to environmental protection.

1 Introduction

General

Model 2256 VLC WEIGHT-PLATE® floor scales are fully electronic scales for general-purpose weighing. They are designed for top-of-floor installations and can be used as portable or permanently mounted scales.

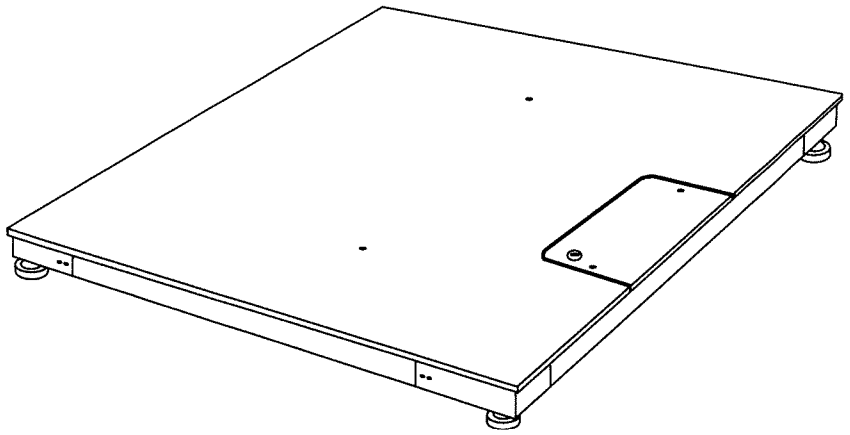

Figure 1-1: 2256 VLC Floor Scale

Model Numbers

The following table shows how standard model numbers are determined for currently available 2256 VLC floor scales.

XXXX	X	X	X	X	X	X	-X
Model	**Revision**	**Platform**	**Load Cell Metrology**	**Junction Box**	**Size**	**Scale Capacity**	**Scale Metrology**
2256	4	0 = Mild steel, tread plate 1 = Mild steel, smooth plate 2 = Stainless steel, tread plate 3 = Stainless steel, smooth plate	2 = H44	0 = Analog	1 = 3x3 feet 2 = 4x4 feet 3 = 4x5 feet 4 = 5x5 feet 5 = 4x6 feet 6 = 5x7 feet	1 = 1,000 lb 2 = 2,500 lb 3 = 5,000 lb 4 = 10,000 lb	-A = 5,000d

Load Cells

Model 2256 VLC floor scales include stainless steel, cantilever-beam load cells with integral, four-conductor, shielded cables (see note). Individual load cell capacities are listed below:

NOTE: Scales measuring 5' x 7' use cables that are 15' long. Smaller scales use cables that are 7.5' long. DO NOT mix cables of different lengths within a platform.

Scale Platform Capacity	Capacity of Each Load Cell	Minimum Approved Graduation Size
1,000 lb	500 lb	0.2 lb
2,500 lb	1,250 lb	0.5 lb
5,000 lb	2,500 lb	1.0 lb
10,000 lb	5,000 lb	2.0 lb

Load Cell Specifications

NOTE: Revision 3 versions of the 2256 floor scale (Model 22563XXXXX-A) used 3-mV/V load cells.

Model Number	745A
Rated Capacity (RC)	500 lb, 1,250 lb, 2,500 lb, 5,000 lb
Rated Output	2 mV/V
Maximum Excitation Voltage*	15 VDC or VAC rms
Recommended Excitation Voltage	15 VDC
Input Terminal Resistance	385 ohms minimum
Output Terminal Resistance	350 ± 2 ohms
Temperature Range (compensated)	+14°F to +104°F (-10°C to +40°C)
Safe Overload	150% RC
Safe Side Load	100% RC
Zero Balance	± 0.02 mV/V

*The power supply to the load cells is provided by the METTLER TOLEDO indicator.

Approvals

NTEP Certification

Model 745A load cells meet or exceed NIST Handbook-44 requirements for Class III 5,000 divisions (multiple cell). A Certificate of Conformance was issued under the National Type Evaluation Program (NTEP) of the National Conference of Weights and Measures (certificate number 92-108A3).

OIML Certification

Model 745A metric capacity load cells meet or exceed OIML requirements for R60 C3 3000 divisions (TC2154).

Entity Approval

Entity approval permits the application of individually approved components (even from various manufacturers) to be used together to build a solution that is approved. When installing equipment in hazardous areas, it is necessary to compare the entity values of the load cells, junction boxes, connecting cables, and other components. Those entity values include voltage, current, power, capacitance, and inductance.

The components must compare as follows in order for the wiring to be considered intrinsically safe:

V_{max} or U_i (Maximum voltage permitted) ≥ V_t or U_o (Total voltage output)

I_{max} or I_i (Maximum current permitted) ≥ I_t or I_o (Total current output)

P_{max} or P_i (Maximum power permitted) ≥ P_t or P_o (Total power output)

C_i (Unprotected capacitance) + C_{cable} (Cable capacitance) ≤ C_a or C_o (Allowable capacitance)

L_i (Unprotected inductance) + L_{cable} (Cable inductance) ≤ L_a or L_o (Allowable inductance)

If the above conditions are not true, then the circuit will not be intrinsically safe and must not be installed in a hazardous area. If the parameters compare favorably as shown above, then the circuit is intrinsically safe and can be installed in a hazardous area. Always refer to the electrical regulations for the country of installation for specific wiring requirements.

United States Approval

The United States safety approvals are based on entity values. Reports on the 745A load cells were submitted to Factory Mutual for compliance with FM Approval Standards Class No. 3600, 3610, and 3810. They were approved as intrinsically safe devices and issued the following certificate:

FM Original Approval Job Identification #3005885
IS/I,II,III/1/ABCDEFG/T4 Ta=40°C – 158574R/5; ENTITY; NI/I/2/ABCD/T6 Ta=40°C; S/II,III/2/FG/T6 Ta=40°C

The following chart lists the Factory Mutual entity values for the load cells.

Electrical Data	745A
V_t (Total voltage output)	25 V
I_t (Total current output)	600 mA
P_t (Total power output)	1.25 W
C_a (Allowable capacitance)	0
L_a (Allowable inductance)	29 µH

When used in hazardous areas, the load cells must be installed according to control drawing 158574R (see Figure 1-2).

European Approval

The European safety approvals are based on entity values. The 745A load cells were submitted to KEMA for compliance with EN60079-0, EN60079-11, EN60079-15, EN61241-0, and EN61241-1. They were approved as intrinsically safe devices and issued the following certificates:

KEMA 03ATEX1069
II 2 G Ex ia IIC T4
II 2 D Ex tD A21 IP6X T100°C

KEMA 03ATEX1070
II 3 G Ex nA II T4
II 3 G Ex nL IIC T4
II 3 D Ex tD A22 IP6X T100°C

The following chart lists the entity values for the load cells.

U_o (Total voltage output)	25 V
I_o (Total current output)	600 mA
P_o (Total power output)	1.25 W
C_o (Allowable capacitance)	5 nF
L_o (Allowable inductance)	30 µH

When used in hazardous areas, the load cells must be installed according to installation instructions document 16792100A (see Figure 1-3).

Junction Boxes

TA100831 junction boxes were submitted to KEMA for compliance with EN60079-0, EN60079-11, EN60079-15, EN61241-0, EN61241-1, and EN61241-11. They were approved as intrinsically safe devices and issued the following certificates:

KEMA 03ATEX1396 X
II 2 G Ex ia IIC T4
II 2 D Ex ibD 21 IP65 T70°C...T90°C

KEMA 03ATEX1397 X
II 3 G Ex nL IIC T4
II 3 G Ex nA II T4
II 3 D Ex tD A22 IP65 T70°C...T90°C

TA100831 junction boxes have been certified to IP69K ingress protection.

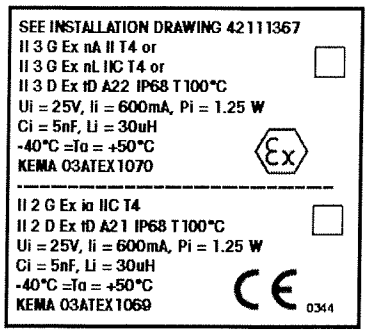
The following chart lists the entity values for the junction boxes.

U_o (Total voltage output)	30 V
I_o (Total current output)	1 A
P_o (Total power output)	0
C_o (Allowable capacitance)	0
L_o (Allowable inductance)	0

When used in hazardous areas, the junction boxes must be installed according to installation instructions document C16953600A (see Figure 1-4).

Product Markings

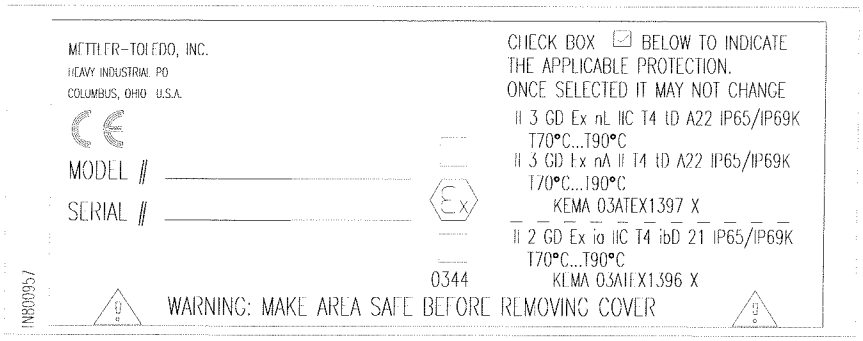
METTLER TOLEDO is not responsible for classifying hazardous areas. Each 745A load cell should have the following label attached to it:



If you install a load cell in a hazardous area, use a permanent marker to place a mark in the check box on the label that indicates the applicable protection (KEMA 03ATEX1069 or KEMA 03ATEX1070). Once the label has been marked, it may not be changed.

Junction Boxes

TA100831 junction boxes should have the following label attached:



If you install a junction box in a hazardous area, use a permanent marker to place a mark in the check box on the label that indicates the applicable protection (KEMA 03ATEX1396 X or KEMA 03ATEX1397 X). Once the label has been marked, it may not be changed.

Grounding

Make sure that all hazardous area installations are properly grounded. All grounding and equal potential bonding connections must be made according to local regulations based upon the country of installation. Refer to local codes and the control drawing provided in this manual for information about grounding.

2 Inspection and Site Selection

Inspection

When the 2256 VLC floor scale is delivered, visually inspect it for any damage that might have occurred during shipping and handling. Inspect the following:

1. Platform assembly
2. Load cells and leveling feet
3. Load cell cables
4. Load cell summing junction box

If you find any damage, contact your freight carrier immediately.

Site Selection

Many problems associated with floor scale installations are caused by improper site conditions. Before installing the scale, check the proposed location for the following conditions:

1. The area where the scale will be located should be level. The scale's leveling feet can be adjusted to compensate for floors that are slightly out of level.
2. The floor/support at each corner of the scale must be strong enough to support weight equal to the maximum weighing capacity of the scale.
3. There should be proper drainage away from the scale.
4. There should be no heavy vibrations or wind currents at or near the scale.
5. The scale should not be subjected to excessive or unusual loading due to the location or type of equipment used.

If the site is acceptable, proceed with the installation. If not, choose a new location or select another scale.

3 Installation

Leveling Feet

Set up the scale in the location where it will be used. To move the scale, install 3/4-10 eyebolts (P/N MZ0905000003) in the threaded holes in the top of the scale platform. Attach a chain to the eyebolts, and use it to lift the scale with a forklift.

1. Remove the corner guard from each corner of the scale (see Figure 3-1).
2. Install a retaining clip in the holes in the side of each load cell. Insert one end of the clip into one hole, and then stretch the clip just enough to insert the opposite end into the other hole. Be careful not to bend the clip.
3. Install a leveling foot in the loading hole in each load cell. Shift the retaining clip to one side of the load cell, and insert the rocker foot into the loading hole at an angle. Rotate the foot until it is fully installed.
4. Install a corner guard at each corner of the scale. Make sure that the corner guard is flush against the load cell mounting block.

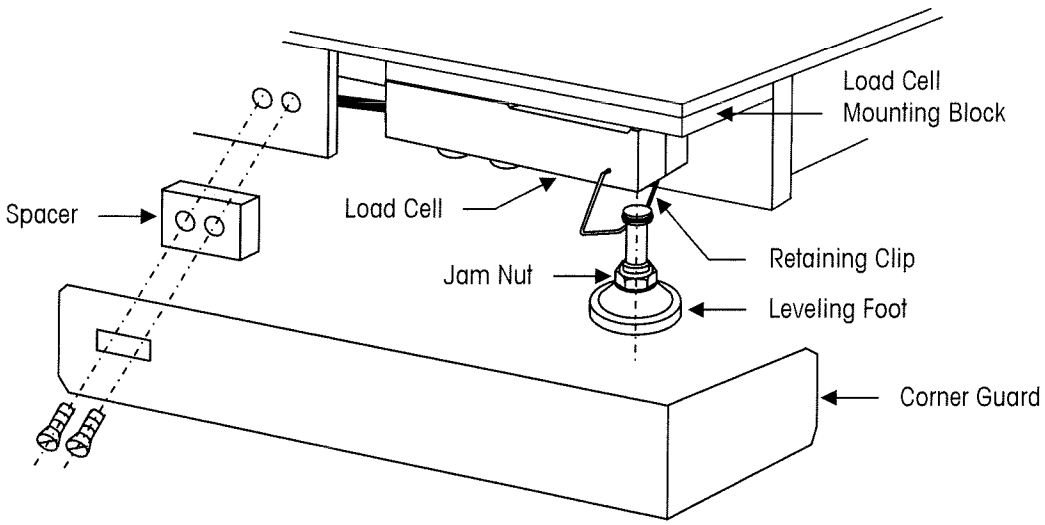

Figure 3-1: Leveling Foot Assembly

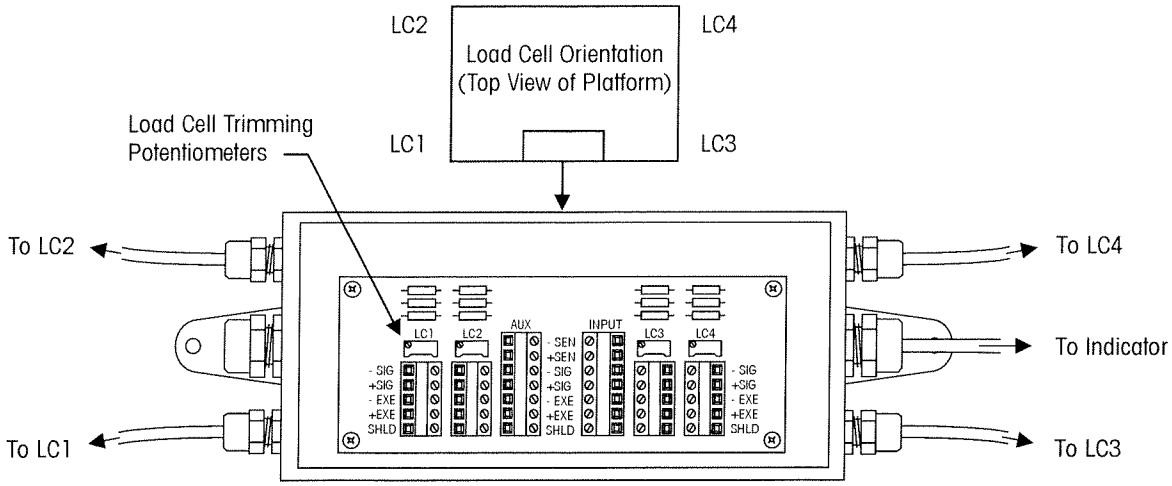
5. Make sure the scale platform is level. Adjust the leveling feet as needed to level it. All four feet should touch the floor so that the scale does not rock.

- To adjust a leveling foot upward or downward, use a 3/4-inch wrench to loosen the jam nut on the foot. Turn the foot until it is positioned correctly, and then tighten the jam nut so that it is snug against the foot.
- Check the level that is located on the scale platform's junction box cover. Adjust the leveling feet until the bubble on the level is centered.
- You must level the scale each time you move it to a new location.

Junction Box Wiring

A 2256 VLC floor scale must be used with a compatible analog indicator. The scale's load cell outputs are summed by an analog junction box. Open the junction box, and connect the home run cable from the scale indicator to the input terminals on the junction box PCB. See Figure 3-2 and Table 3-1 for the correct cable connections.



NOTE: Do not cut load cell cables. Cutting a cable will affect compensation and void the warranty.

Figure 3-2: Analog Junction Box Detail

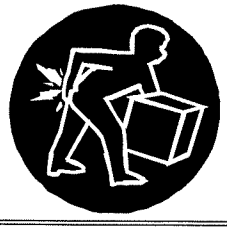
NOTE: Turn all potentiometers fully clockwise prior to calibration.

Load Cell Wiring		Instrument Cable Wiring*	
Function	**Color**	**Function**	**Color**
-Sense	Not Used	-Sense	Red
+Sense	Not Used	+Sense	Yellow
-Signal	Red	-Signal	Black
+Signal	White	+Signal	Green
-Excitation	Black	-Excitation	Blue
+Excitation	Green	+Excitation	White
Shield	Yellow	Shield	Orange
*Instrument cable color code based on METTLER TOLEDO cable no. 510624370			

Table 3-1: Analog Junction Box Wiring Codes

Optional Locating Plates

Locating plates are available for scales that will be mounted permanently. Two locating plates installed at adjacent corners of a scale are usually sufficient.



⚠ WARNING

USE EXTREME CAUTION WHEN LIFTING AND MOVING THE SCALE TO THE DESIRED LOCATION. DO NOT ATTEMPT TO LIFT AND MOVE THE SCALE BY YOURSELF OR INJURY COULD OCCUR.

1. Remove the rubber pads from the scale's leveling feet, and position the scale in the location where it will be installed.
2. Lift the scale enough to position the locating plates under the corners of the scale.
3. Lower the scale carefully so that its leveling feet fit inside the large holes in the locating plates.
4. Drill holes in the floor for the anchor bolts (two for each locating plate). Use the bolt holes in the plates as guides (see Figure 3-3).
5. Install 1/2-inch insert-type anchor bolts through the bolt holes in the locating plates to anchor the plates to the floor.

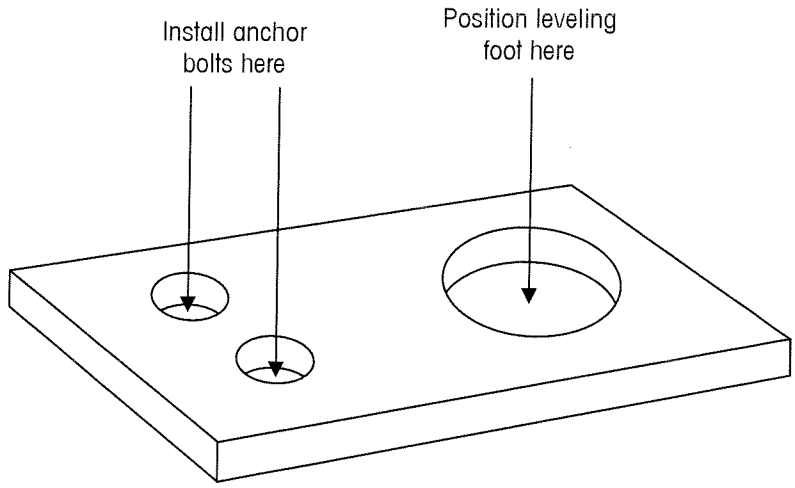


Figure 3-3: Locating Plate Installation

Optional Ramps

You can install one or more ramps with a floor scale. Standard ramps are available in widths of 36, 48, and 60 inches.

⚠ WARNING

USE EXTREME CAUTION WHEN LIFTING AND MOVING THE SCALE TO THE DESIRED LOCATION. DO NOT ATTEMPT TO LIFT AND MOVE THE SCALE BY YOURSELF OR INJURY COULD OCCUR.

1. Remove the rubber pads from the scale's leveling feet.
2. Position the ramp in the location where it will be installed. Make sure there is enough room for the scale and for any other ramps that will be installed.
3. Drill holes in the floor for the two anchor bolts. Use the bolt holes in the flanged portion of the ramp as guides (see Figure 3-4).
4. Install 1/2-inch insert-type anchor bolts through the bolt holes in the flange to anchor the ramp to the floor.
5. Lower the scale carefully so that its leveling feet fit inside the large holes in the flange.

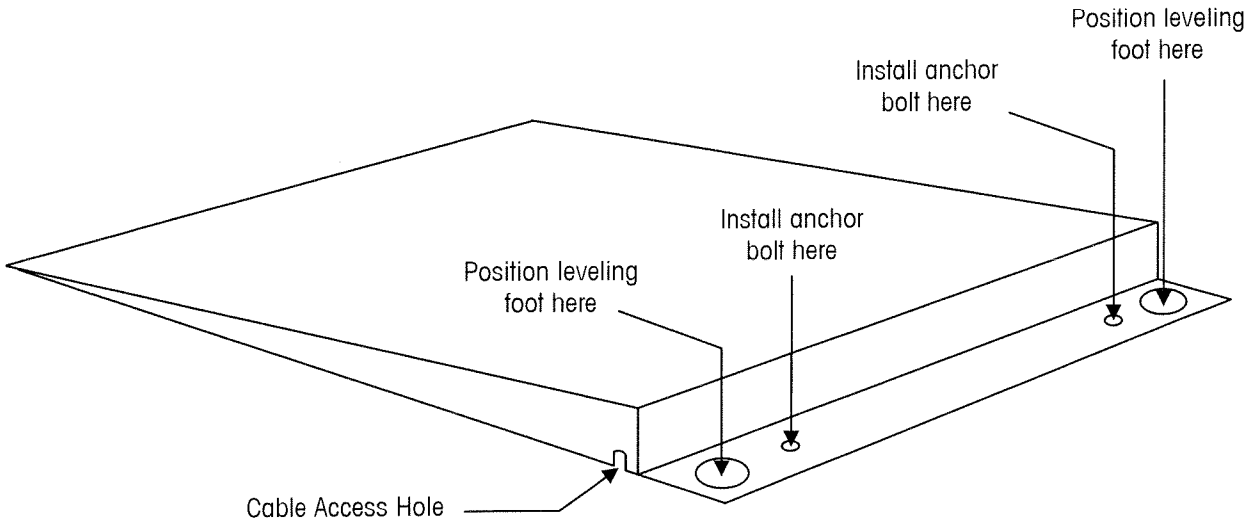

Figure 3-4: Ramp Installation

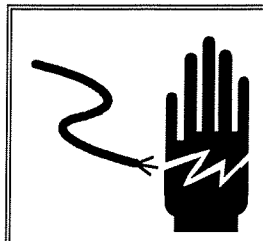
If you will be installing a second ramp, lift the scale and position the large holes in the ramp's flange under the leveling feet on the opposite side of the scale. Then move the scale out of the way. Drill bolt holes, install anchor bolts, and then lower the scale carefully so that its leveling feet fit inside the large holes in the ramp flanges.

4 Calibration

Shift Adjust



⚠ WARNING

PERMIT ONLY QUALIFIED PERSONNEL TO SERVICE THIS EQUIPMENT. EXERCISE CARE WHEN MAKING CHECKS, TESTS, AND ADJUSTMENTS THAT MUST BE MADE WITH POWER ON. FAILING TO OBSERVE THESE PRECAUTIONS CAN RESULT IN BODILY HARM.

When you shift adjust a scale, you are adjusting the output voltage (signal) of each load cell so that all load cells in the system produce a consistent signal. A correctly adjusted scale will give the same weight reading no matter where on the platform you place a test weight. Each floor scale is shift adjusted at the factory. For a new installation, the only adjustment that should be needed is minor load cell trimming.

After the scale has been installed, check all mechanical parts to make sure that they work properly. Then check the scale's repeatability by placing a test weight on the same location on the platform several times to make sure that you get the same weight reading each time. After checking for repeatability, adjust the load cell trimming potentiometers as needed.

Analog Junction Box Shift Adjustment

Use the following procedure to trim the load cells:

1. Remove the access plate from the scale platform, and open the junction box.
2. Figure 4-1 shows test weight locations (A, B, C, and D) at the center of each quadrant of the scale platform. Place a test weight equal to 1/2 of the rated scale capacity at location A and record the weight reading. Then move the test weight to location B and record the weight reading. Continue until you have taken a weight reading at each of the four locations.

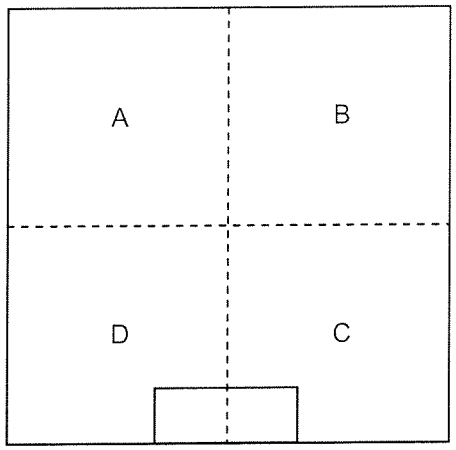


Figure 4-1: Test Weight Locations

3. Place the test weight at the location immediately clockwise from the location at which you got the lowest weight reading. Then adjust the trimming potentiometer for the load cell that corresponds to the corner of the scale where the test weight is positioned (see Figure 4-2). Make the adjustment by turning the potentiometer until the weight reading matches the lowest reading.

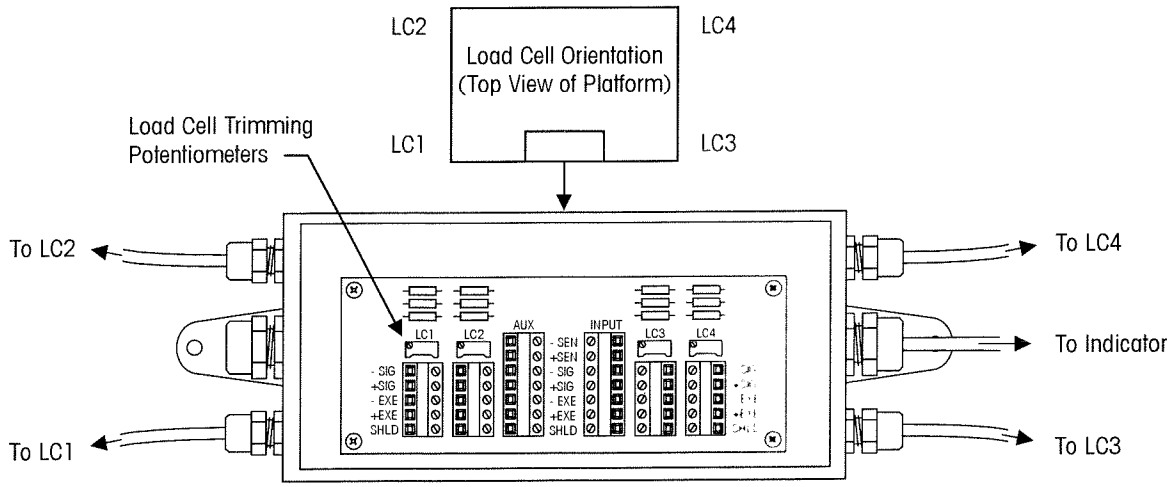

Figure 4-2: Load Cell Trimming Potentiometers

4. Proceeding clockwise, repeat the adjustment described in Step 3 for the next two test weight locations.

   NOTE: Because the trimming potentiometers interact with each other, any adjustment will affect the weight readings at all four corners of the scale.

5. Repeat Steps 2 to 4 until the weight readings at all corners of the platform are the same or are within the specified National Institute of Standards and Technology (NIST) Handbook 44 Scale Accuracy Requirements.

6. Replace the junction box lid and the access plate.

Scale Calibration

METTLER TOLEDO recommends calibrating the scale using test weights equal to the scale's capacity. Follow the calibration instructions in the manual provided with the scale indicator.

5 Routine Care and Maintenance

General

Once the scale has been installed, have an authorized METTLER TOLEDO representative inspect and calibrate it periodically. If the scale is used for legal-for-trade purposes, consult the local weights and measures authorities for minimum inspection requirements. Contact your local authorized METTLER TOLEDO service representative for information about periodic inspection and calibration services.

Site Inspection

Make sure that the scale site remains in good condition. Check for alterations in the surrounding floor, excessive vibrations, and possible overloading conditions.

Platform Inspection

During periodic inspections of the scale, check the following:

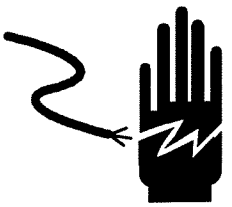
1. Are there any unusual wear points, paths, or marks on the weighing platform?
2. Is the junction box lid properly sealed and are all cable connectors tight against the enclosure?
3. Is there any moisture or foreign material around or inside the junction box assembly?
4. Is the instrument cable damaged or binding the scale?
5. Is there any debris or material build-up under or around the platform that could prevent the platform from moving freely?
6. Visually inspect the load cells and leveling feet for signs of unusual wear.
7. Check repeatability and shift of the scale.

6 Troubleshooting

General

If the scale does not operate properly, find out as much about the problem as possible. Try to determine whether the problem is constant or intermittent. Mechanical and electrical influences can cause malfunctions, so be patient and use sound logic when troubleshooting.

When troubleshooting a 2256 VLC floor scale, examine the scale's physical location. Check for the presence of water, corrosive materials, unlevel floors, high vibrations, air currents, or physical damage to the scale platform or frame. Also check the instrument cable for damage, and check all connections for loose or improper wiring.



⚠ WARNING

PERMIT ONLY QUALIFIED PERSONNEL TO SERVICE THIS EQUIPMENT. EXERCISE CARE WHEN MAKING CHECKS, TESTS, AND ADJUSTMENTS THAT MUST BE MADE WITH POWER ON. FAILING TO OBSERVE THESE PRECAUTIONS CAN RESULT IN BODILY HARM.

⚠ CAUTION

BEFORE CONNECTING/DISCONNECTING ANY INTERNAL ELECTRONIC COMPONENTS OR INTERCONNECTING WIRING BETWEEN ELECTRONIC EQUIPMENT, ALWAYS REMOVE POWER AND WAIT AT LEAST THIRTY (30) SECONDS. FAILURE TO OBSERVE THESE PRECAUTIONS COULD RESULT IN BODILY HARM OR DAMAGE TO OR DESTRUCTION OF THE EQUIPMENT.

Isolate the Problem

Determine whether the problem is in the scale or the indicator.

1. Remove power from the system, and then disconnect the indicator from the scale.
2. Connect the indicator to a load cell simulator (analog simulator available from METTLER TOLEDO).
3. Reapply power and test the indicator. If the problem persists, consult the indicator manual for further troubleshooting assistance.
4. If the problem is NOT present with the load cell simulator attached to the indicator, remove power, disconnect the simulator, and reconnect the scale. If the problem persists, continue troubleshooting the scale.

Check Wiring

1. Remove power from the system.
2. Remove the access cover plate from the scale platform.
3. Remove the lid from the junction box and check the interior for moisture and foreign material.
4. Make sure that all wiring connections are tight and that no insulation material is touching the terminal contacts.
5. Check all cable connections to make sure they are wired correctly. The wiring color codes are given in Table 6-1:

Load Cell Wiring		Instrument Cable Wiring*	
Function	**Color**	**Function**	**Color**
-Sense	Not Used	-Sense	Red
+Sense	Not Used	+Sense	Yellow
-Signal	Red	-Signal	Black
+Signal	White	+Signal	Green
-Excitation	Black	-Excitation	Blue
+Excitation	Green	+Excitation	White
Shield	Yellow	Shield	Orange
*Instrument cable color code based on METTLER TOLEDO cable no. 510624370			

Table 6-1: Load Cell Wiring Color Codes

6. Check all cable connectors and cord grip caps on the junction box.
7. Tighten any loose connectors.

Check Load Cells

1. Remove power from the system. Fully disconnect each load cell and check for proper input/output resistances (see Table 6-2).

NOTE: The information in this section is for 2-mV/V load cells.

Measuring Points	Resistance
+Exc (Green) to -Exc (Black)	385 ohms minimum
+Sig (White) to -Sig (Red)	348-352 ohms

Table 6-2: Load Cell Measuring Points

2. If resistance is within specification, perform a shorted-signal symmetry test.
   - Short the signal leads together and place one multimeter lead on the shorted signals and one lead on the +Excitation wire. Note the resistance value.
   - Remove the lead from the +Excitation wire and place it on the -Excitation wire. The two resistance values should be approximately equal.
3. If the load cells pass the shorted-signal test, reconnect them and reapply power to the scale. Confirm that the proper excitation voltage is reaching the load cells by placing multimeter leads on the excitation positions of each load cell terminal.
4. If proper excitation voltage is reaching the load cells, check the output signal from each cell by disconnecting the signal leads and measuring voltage output. If one cell has a particularly high or low dead-load output, it is suspect. The maximum output possible from any cell is 30 mV at 15 VDC excitation and loaded to gross capacity.
5. If any load cell has an unusual signal, remove all load from that cell by raising the platform.

NOTE: Remove signal leads from terminals to measure output.

   - With the power on, measure the output from the suspect load cell. The no-load zero output should be ± 1.5% of the full scale output. For example, if the excitation voltage is 15 VDC, then the full scale output would be 30 mV and the no-load zero output should be within ± 0.45 mV.
6. If a load cell fails any of the above tests, replace it.

INSTALLATION MAINTENANCE, OPERATING INSTRUCTIONS

IM-190

PLUG FANS
PLENUM FANS

⚠ WARNING

THIS FAN HAS MOVING PARTS THAT CAN CAUSE SERIOUS BODILY INJURY. BEFORE OPERATING OR STARTING MAINTENANCE READ THE INSTALLATION AND MAINTENANCE INSTRUCTIONS AND THE AMCA SAFETY PRACTICES MANUAL PROVIDED WITH THIS FAN.

DURING OPERATION

1. KEEP BODY, HANDS, AND FOREIGN OBJECTS AWAY FROM THE INLET, THE OUTLET, AND THE OTHER MOVING PARTS OF THE FAN SUCH AS SHAFTS, BELTS, AND PULLEYS.

2. DO NOT OPERATE AT EXCESSIVE SPEEDS OR TEMPERATURES.

BEFORE STARTING MAINTENANCE WORK:

LOCK POWER SUPPLY IN OFF POSITION AND IMMOBILIZE FAN WHEEL.

98-0250

A WORD ABOUT SAFETY

The above **WARNING** decal appears on all **nyb** fans. Air moving equipment involves electrical wiring, moving parts, sound, and air velocity or pressure which can create safety hazards if the equipment is not properly installed, operated and maintained. To minimize this danger, follow these instructions as well as the additional instructions and warnings on the equipment itself.

All installers, operators and maintenance personnel should study AMCA Publication 410, "Recommended Safety Practices for Air Moving Devices", which is included as part of every shipment. Additional copies can be obtained by writing to New York Blower Company, 7660 Quincy St., Willowbrook, IL 60521.

ELECTRICAL DISCONNECTS

Every motor driven fan should have an independent disconnect switch to isolate the unit from the electrical supply. It should be near the fan and must be capable of being locked by maintenance personnel while servicing the unit, in accordance with OSHA procedures.

MOVING PARTS

All moving parts must have guards to protect personnel. Safety requirements vary, so the number and type of guards needed to meet company, local and OSHA standards must be determined and specified by the user. Never start a fan without having all safety guards installed. Check regularly for damaged or missing guards and do not operate any fan with guards removed. Fans can also become dangerous because of potential "windmilling", even though all electrical power is disconnected. Always block the rotating assembly before working on any moving parts.

SOUND

Some fans can generate sound that could be hazardous to exposed personnel. It is the responsibility of the system designer and user to determine sound levels of the system, the degree of personnel exposure, and to comply with applicable safety requirements to protect personnel from excessive noise. Consult **nyb** for fan sound power level ratings.

AIR PRESSURE AND SUCTION

In addition to the normal dangers of rotating machinery, fans present another hazard from the suction created at the fan inlet. This suction can draw materials into the fan where they become high velocity projectiles at the outlet. It can also be extremely dangerous to persons in close proximity to the inlet, as the forces involved can overcome the strength of most individuals. Inlets and outlets that are not ducted should be screened to prevent entry and discharge of solid objects.

⚠ DANGER

DO NOT OPEN UNTIL THE POWER SUPPLY HAS BEEN LOCKED OFF AND THE SHAFT HAS STOPPED ROTATING.
FAILURE TO DO THIS CAN RESULT IN SERIOUS BODILY INJURY. 98-0249

ACCESS DOORS

The above DANGER decal is placed on all **nyb** cleanout doors. These doors, as well as access doors to the duct system, should never be opened while the fan is in operation. Serious injury could result from the effects of air pressure or suction.

Quick-opening doors must have the door handle bolts securely tightened to prevent accidental or unauthorized opening. Bolted doors must be tightened for the same reason.

RECEIVING AND INSPECTION

The fan and accessories should be inspected on receipt for any shipping damage. Turn the wheel by hand to see that it rotates freely and does not bind.

F.O.B. factory shipping terms require that the receiver be responsible for inspecting the equipment upon arrival. Note damage or shortages on the Bill of Lading and file any claims for damage or loss in transit. **nyb** will assist the customer as much as possible; however, claims must be originated at the point of delivery.

HANDLING AND STORAGE

Fans should be lifted by the base, mounting supports, or lifting eyes only. Never lift a fan by the wheel, shaft, motor, motor bracket, or any fan part not designed for lifting. A spreader should be used to avoid damage.

Whenever possible, fans and accessories should be stored in a clean, dry location to prevent rust and corrosion of steel components. If outdoor storage is necessary, protection should be provided. Cover the entire fan to prevent the accumulation of dirt and moisture in the housing. Cover motors with waterproof material. Refer to the bearing section for further storage instructions. Inspect the stored unit periodically. **Rotate the wheel by hand every two weeks to redistribute grease on internal bearing parts.**

FAN INSTALLATION

nyb wheels are dynamically balanced when fabricated. Fully assembled fans are test run at operating speeds to check the entire assembly for conformance to **nyb** vibration limits. Nevertheless, all units must be adequately supported for smooth operation. **Ductwork or stacks should be independently supported as excess weight may distort the fan housing and cause contact between moving parts.** Where vibration isolators are used, consult the **nyb** certified drawing for proper location and adjustment.

nyb fans are designed for smooth operation throughout the cataloged speed range. Vibration levels are dependent upon the rigidity of the support structure on which the fan is mounted. The optimum installation is one in which the Plug Fan mounting panel or Plenum Fan base is bolted directly to the main supporting structurals of the particular system (see Figure 1). By doing so, the entire machine provides the mass and rigidity necessary to insure smooth operation.

The Plug Fan mounting panel has a formed edge to add strength and the face of the panel is provided with prepunched holes. The Plenum Fan base is also provided with predrilled holes. These holes are large enough to allow alignment at the time of installation yet still accept a large enough mounting bolt or stud to ensure ample security. All of the mounting holes should be used.

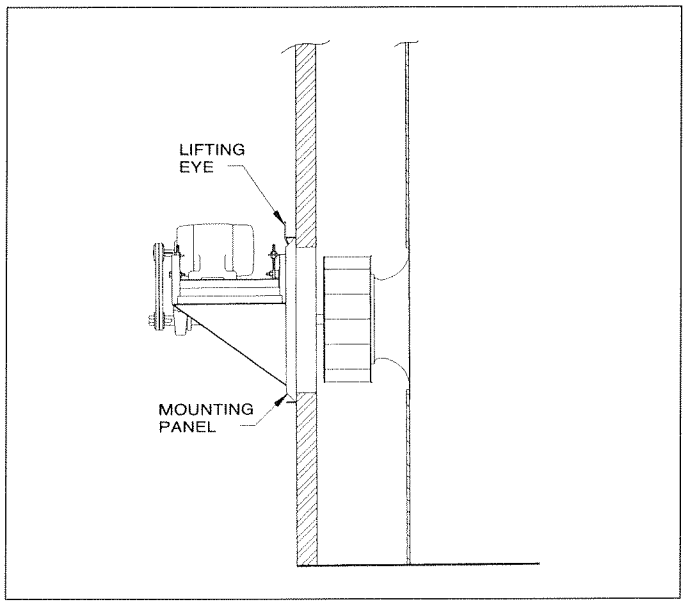

Figure 1

Typical Plug Fan Installation

For Plug Fans, the inlet cone support must be supplied by the user. In most cases, this is an internal baffle or plenum wall. The baffle or wall must be properly located and be straight to ensure optimum wheel-to-inlet cone clearance. It must also be sufficiently rigid to prevent movement of the cone during operation.

V-BELT DRIVE

Installation

1. Remove all foreign material from the fan and motor shafts. Coat shafts with machine oil for easier mounting. Mount all guards at this time if partial installation is required prior to sheave mounting.
2. Mount sheaves on shafts after checking sheave bores and bushings for nicks or burrs. Avoid using force. If resistance is encountered, lightly polish the shaft with emery cloth until the sheave slides on freely. Tighten tapered bushing bolts sequentially so that equal torque is applied to each.
3. Adjust the motor on its base to a position closest to the fan shaft. Install belts by working each one over the sheave grooves until all are in position. Never pry the belts into place. On **nyb** packaged fans, sufficient motor adjustment is provided for easy installation of the proper size belts.
4. Adjust sheaves and the motor shaft angle so that the sheave faces are in the same plane. Check this by placing a straightedge across the face of the sheave. Any gap between the edge and sheave faces indicates misalignment. Important: This method is only valid when the width of the surface between the belt edge and the sheave face is the same for both sheaves. When they are not equal, or when using adjustable-pitch sheaves, adjust so that all belts have approximately equal tension. Both shafts should be at the right angles to the center belt.

Belt Tensioning

1. Check belt tension with a tensioning gage and adjust using the motor slide base. Excess tension shortens bearing life while insufficient tension shortens belt life, can reduce fan performance and may cause vibration. The lowest allowable tension is that which prevents slippage under full load. Belts may slip during start-up, but slipping should stop as soon as the fan reaches full speed. For more precise tensioning methods, consult the drive manufacturer's literature.
2. Recheck setscrews, rotate the drive by hand and check for rubbing, then complete the installation of the belt guard.
3. Belts tend to stretch somewhat after installation. Recheck tension after several days of operation. Check sheave alignment as well as setscrew and/or bushing bolt tightness.

START-UP

Safe operation and maintenance includes the selection and use of appropriate safety accessories for the specific installation. This is the responsibility of the system designer and requires consideration of equipment location and accessibility as well as adjacent components. All safety accessories must be installed properly prior to start-up.

Safe operating speed is a function of system temperature and wheel design. Do not under any circumstances exceed the maximum safe fan speed published in the **nyb** bulletin, which is available from your **nyb** field sales representative.

Procedure

1. If the drive components are not supplied by **nyb**, verify with the manufacturer that the starting torque is adequate for the speed and inertia of the fan.
2. Inspect the installation prior to starting the fan. Check for any loose items or debris that could be drawn into the fan or dislodged by the fan discharge. Check the interior of the fan as well. Turn the wheel by hand to check for binding.

⚠ CAUTION

BEFORE INITIAL OPERATION:

1. **TIGHTEN ALL SET SCREWS IN FAN WHEEL.**
2. **TIGHTEN ALL SET SCREWS IN BEARINGS.**
3. **REPEAT AFTER 8 HOURS OF OPERATION.**
4. **REPEAT AGAIN AFTER TWO WEEKS OPERATION.**

98-0271

3. Check drive installation and belt tension.
4. Check the tightness of all setscrews, nuts and bolts. When furnished, tighten hub setscrews with the wheel oriented so that the setscrew is positioned underneath the shaft.
5. Install all remaining safety devices and guards. Verify that the supply voltage is correct and wire the motor. "Bump" the starter to check for proper wheel rotation.
6. Use extreme caution when testing the fan with plenum ducting disconnected. Apply power and check for unusual sounds or excessive vibration. If either exists, see the section on Common Fan Problems. To avoid motor overload, do not run the fan for more than a few seconds if plenum is not fully installed. Without plenum ductwork, normal operating speed may not be obtained without motor overload. Once plenum ductwork is complete, check for correct fan speed and complete installation. Plenum ductwork and guards must be fully installed for safety.
7. Setscrews should be rechecked after a few minutes, eight hours and two weeks of operation (see Tables 1 & 2 for correct tightening torques).

NOTE: Shut the fan down immediately if there is any sudden increase in fan vibration.

Table 1 - WHEEL SETSCREW TORQUES

Setscrew Size Diameter (in.)	Carbon Steel Setscrew Torque*	
	lb.-in.	lb.-ft.
1/4	75	6.2
5/16	144	12
3/8	252	21

FAN MAINTENANCE

nyb fans are manufactured to high standards with quality materials and components. Proper maintenance will ensure a long and trouble-free service life.

Do not attempt any maintenance on a fan unless the electrical supply has been completely disconnected and locked. In many cases, a fan can windmill despite removal of all electrical power. The rotating assembly should be blocked securely before attempting maintenance of any kind.

The key to good fan maintenance is regular and systematic inspection of all fan parts. Inspection frequency is determined by the severity of the application and local conditions. Strict adherence to an inspection schedule is essential.

Regular fan maintenance should include the following:

1. Check the fan wheel for any wear or corrosion, as either can cause catastrophic failures. Check also for the build-up of material which can cause unbalance resulting in vibration, bearing wear and serious safety hazards. Clean or replace the wheel as required.
2. Check the V-belt drive for proper alignment and tension (see section on V-belt drives). If belts are worn, replace them as a set, matched to within manufacturer's tolerances. Lubricate the coupling of direct-drive units and check for alignment (see section on couplings).
3. Lubricate the bearings, but do not over lubricate (see the bearing section for detailed specifications).
4. Ceramic-felt shaft seals require no maintenance, although worn seals should be replaced.
5. During any routine maintenance, all setscrews and bolts should be checked for tightness. See tables for torques.
6. When installing a new wheel or cone, the proper wheel-to-inlet cone clearance must be maintained (see Figure 2).

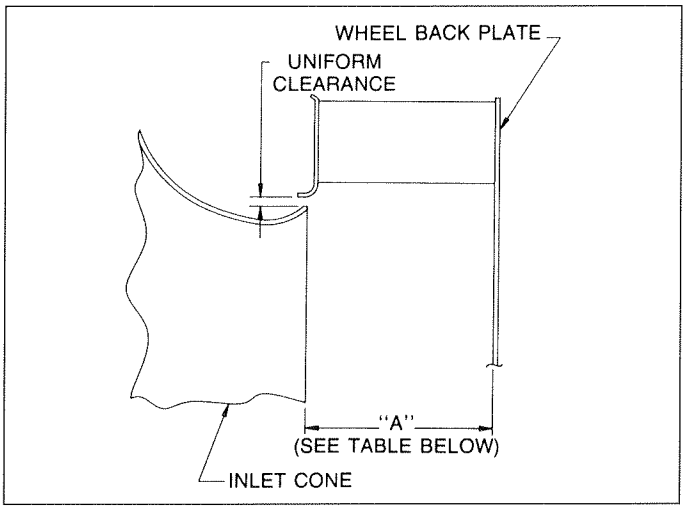
WHEEL BALANCE

Airstreams containing particulate or chemicals can cause abrasion or corrosion of the fan parts. This wear is often uneven and can lead to significant wheel unbalance over time. When such wear is discovered, a decision must be made as to whether to rebalance or replace the wheel.

The soundness of all parts should be determined if the original thickness of components is reduced. Be sure there is no hidden structural damage. The airstream components should also be cleaned to remove any build-up of foreign material. Specialized equipment can be used to rebalance a cleaned wheel that is considered structurally sound.

Balance weights should be rigidly attached at a point that will not interfere with the housing nor disrupt airflow. Remember that centrifugal forces can be extremely high at the outer radius of a fan wheel. Welding is the preferred method of balance weight attachment. Be sure to ground the welder directly to the fan wheel. Otherwise, the welding current could pass through the fan bearings and damage them.

WHEEL-CONE CLEARANCES



Fan Size	"A" Dimension	Fan Size	"A" Dimension
12	4 1/2	30	11 1/4

		73	26 1/2

Figure 2

BEARINGS

Storage

Any stored bearing can be damaged by condensation caused by temperature variations. Therefore, **nyb** fan bearings are filled with grease at the factory to exclude air and moisture. Such protection is adequate for shipment and subsequent immediate installation.

For long term or outdoor storage, mounted bearings should be regreased and wrapped with plastic for protection. **Rotate the fan wheel by hand at least every two weeks to redistribute grease on internal bearing parts.** Each month the bearings should be purged with new grease to remove condensation, since even a filled bearing can accumulate moisture. Use caution when purging, as excessive pressure can damage the seals. Rotate the shaft while slowly adding grease.

Operation

Check the setscrew torque before start-up (see Table 2 for correct values). Since bearings are completely filled with grease at the factory, they may run at an elevated temperature during initial operation. Surface temperatures may reach 180°F. and grease may bleed from the bearing seals. This is normal and no attempt should be made to replace lost grease. Bearing surface temperatures will decrease when the internal grease quantity reaches a normal operating level. Relubrication should follow the recommended schedule.

Lubrication

Use the table for relubrication scheduling according to operating speed and shaft diameter. Bearings should be lubricated with a premium quality lithium-based grease conforming to NLGI Grade 2 or 3. Examples are:

Mobil	-	Mobilith AW2
Texaco	-	Premium RB
Gulf Oil	-	Gulf Crown #2 or #3
Shell	-	Alvania #2 or #3

Do not use "high temperature" greases, as many are not formulated to be compatible with fan bearings.

Add grease to the bearing while running the fan or rotating the shaft by hand. Be sure all guards are in place if lubrication is performed while the fan is operating. Add just enough grease to cause a slight purging at the seals. Do not over lubricate.

COMMON FAN PROBLEMS

Excessive Vibration

A common complaint regarding industrial fans is "excessive vibration". **nyb** is careful to ensure that each unit is precisely balanced prior to shipment; however, there are many other causes of vibration including:

1. Loose mounting bolts, setscrews, bearings or couplings.
2. Misalignment or excessive wear of couplings or bearings.
3. Misaligned or unbalanced motor.
4. Bent shaft due to mishandling or material impact.
5. Accumulation of foreign material on the wheel.
6. Excessive wear or erosion of the wheel.
7. Excessive system pressure or restriction of airflow due to closed dampers.
8. Inadequate structural support, mounting procedures or materials.
9. Externally transmitted vibration.

Inadequate Performance

1. Incorrect testing procedures or calculations.
2. Fan running too slowly.
3. Fan wheel rotating in wrong direction.
4. Wheel not properly centered relative to inlet cone.
5. Poor system design, closed dampers, air leaks, clogged filters, or coils.
6. Obstructions or sharp elbows near inlets.
7. Sharp deflection of airstream at fan outlet.

Excessive Noise

1. Fan operating near "stall" due to incorrect system design or installation.
2. Vibration originating elsewhere in the system.
3. System resonance or pulsation.
4. Improper location or orientation of fan intake and discharge.
5. Inadequate or faulty design of supporting structures.
6. Nearby sound reflecting surfaces.
7. Loose accessories or components.
8. Loose drive belts.
9. Worn bearings.

Premature Component Failure

1. Prolonged or major vibration.
2. Inadequate or improper maintenance.
3. Abrasive or corrosive elements in the airstream or surrounding environment.
4. Misalignment or physical damage to rotating components or bearings.
5. Bearing failure from incorrect or contaminated lubricant or grounding through the bearings while arc welding.
6. Excessive fan speed.
7. Extreme ambient or airstream temperatures.
8. Improper belt tension.
9. Improper tightening of wheel setscrews.

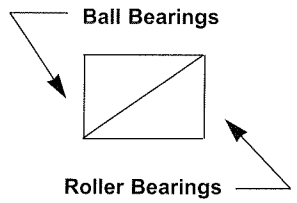
3 7/16 thru 4 3/16	4-6 / 4	3-5 / 2	2-4 / 1	1-2 / 1/2	1 /					



NOTE:

1. **These are general recommendations only; specific manufacturer's recommendations may vary slightly.**
2. **Assumes clean environment, 0°F. to 120°F.**
   a. **Consult The New York Blower Company for operation below 0°F. ambient.**
   b. **Ambient temperatures greater than 120°F. will shorten bearing life.**
   c. **Under extremely dirty conditions, lubricate more frequently.**
3. **Assumes horizontal mounting configuration. For vertically mounted applications, lubricate twice as frequently.**

LIMITED PRODUCT WARRANTY

All products are warranted by **nyb** to be free from defects in materials and workmanship for a period of one (1) year after shipment from its plant, provided buyer demonstrates to satisfaction of **nyb** that the product was properly installed and maintained in accordance with **nyb**'s instructions and recommendations and that it was used under normal operating conditions.

This warranty is limited to the replacing and/or repairing by **nyb** of any part or parts which have been returned to **nyb** with **nyb**'s written authorization and which in **nyb**'s opinion are defective. Parts not manufactured by **nyb** but installed by **nyb** in equipment sold to the buyer shall carry the original manufacturer's warranty only. All transportation charges and any and all sales and use taxes, duties, imports or excises for such part or parts shall be paid for by the buyer. **nyb** shall have the sole right to determine whether defective parts shall be repaired or replaced.

This warranty does not cover any customer labor charges for replacement of parts, adjustments or repairs, or any other work unless such charges shall be assumed or authorized in advance, in writing, by **nyb**.

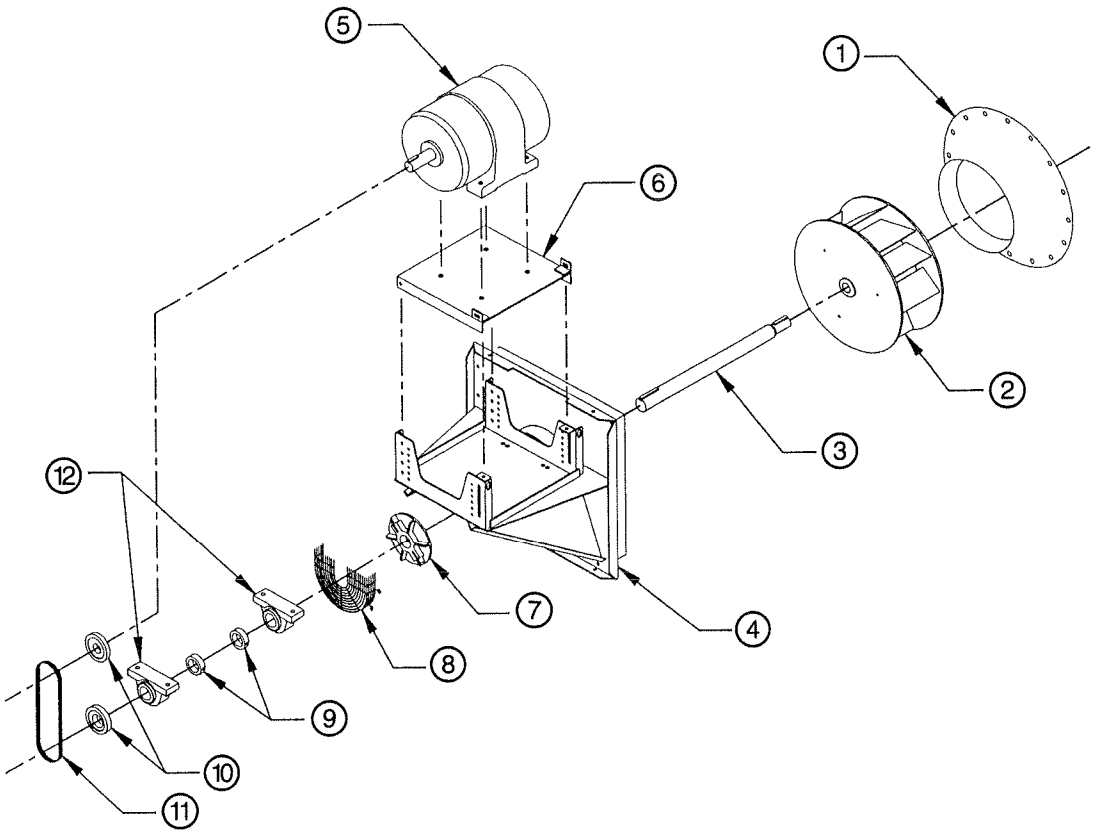
This warranty does not cover any product which, in the judgement of **nyb**, has been subject to misuse or neglect, or which has been repaired or altered outside **nyb**'s plant in any way which may have impaired its safety, operation or efficiency, or any product which has been subject to accident.

This warranty shall be null and void if any part not manufactured or supplied by **nyb** for use in any of its products shall have been substituted and used in place of a part manufactured or supplied by **nyb** for such use.

There are no warranties, other than those appearing on the acknowledgement form **INCLUDING NO WARRANTY OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE**, given in connection with the sale of the goods sold hereunder. The buyer agrees that his sole and exclusive remedy, and the limit of **nyb**'s liability for loss from any cause whatsoever, shall be the purchase price of the goods sold hereunder for which a claim is made.

SPECIFY ROTATION AS VIEWED FROM DRIVE SIDE

ARROW INDICATES COUNTERCLOCKWISE ROTATION



REPLACEMENT PARTS

It is recommended that only factory-supplied replacement parts be used. **nyb** fan parts are built to be fully compatible with the original fan, using specific alloys and tolerances. These parts carry a standard **nyb** warranty.

When ordering replacement parts, specify the part name, **nyb** shop control number, fan size, type, rotation (viewed from drive end), and bearing size or bore. Most of this information is on the metal nameplate attached to the fan base.

For assistance in selecting replacement parts, contact your local **nyb** representative or visit: http://www.nyb.com.

Example: Part required: Wheel

Parker FluidConnectors

451TC and 451ST Hydraulic Hoses: abrasion resistance and versatility

Parker 451TC and 451ST hydraulic hoses are what to specify when abrasion resistance and ease of use are required. Plus, you can choose the cover that provides the abrasion resistance for your application.

- **Tough Cover —** 451TC features a specially formulated MSHA-accepted cover that offers exceptional protection from hose-to-hose or hose-to-object abrasion. Hose lines last longer, minimizing maintenance and down time.
- **Super Tough cover —** When only maximum abrasion resistance will do, specify 451ST with the polymeric cover.
- **Flexible —** 451 features a one-half SAE 100R1 minimum bend radius, making installation in tight spaces fast and simple.
- **Constant pressure rating in all sizes —** With a 3,000 psi constant working pressure through all sizes, 451 is the one hose you can specify to cover almost every hydraulic application. So you can stock fewer hose types and simplify your inventory.

Construction

Synthetic rubber tube compatible with most petroleum-base hydraulic fluids; high-tensile steel wire reinforcement; and an oil-, weather-, and an abrasion-resistant black synthetic MSHA-accepted rubber cover or a high abrasion-resistant polymeric cover.

Applications and temperature ranges

- Most petroleum-based hydraulic fluids and lubrication oils within a temperature range of -40˚F to +212˚F (-40˚C to +100˚C).
- Water, water/oil emulsion, and water/glycol hydraulic fluids up to +185˚F (+85˚C).
- Air up to +158˚F (+70˚C).

Parkrimp compatible

Parker 43 Series crimp fittings, 451TC hose, and 451ST hose are compatible with the Parkrimp system of crimpers. So assembly is as simple as 1-2-3.

Part Number		Hose		Hose		Maximum Working Pressure		Minimum Burst Pressure		Minimum Bend Radius		Weight		Crimp Fitting
		inch	mm	inch	mm	psi	MPa	psi	MPa	inch	mm	lbs/ft	kg/m	Series
451TC-4	451ST-4	1/4	6,3	0.52	13	3000	21,0	12000	84,0	2	50	0.16	0,24	43

Parker Heavy Duty Hydraulic Cylinders

Series 2H

Exclusive with the Parker Stepped Cushion for increased performance and productivity

- **Faster cycle time**
- **Reduced hydraulic shock**
- **Reduced machine noise**
- **Lower machine maintenance**

- **Heavy Duty Service – Industrial Tie-Rod Construction**
- **Nominal Pressure – 3000 PSI**
- **Standard Bore Sizes – 1-1/2" through 6"**
- **Piston Rod Diameters – 5/8" through 4"**
- **18 Standard Mounting Styles**

For Cylinder Division Plant Locations – See Page II.

Parker Cylinder

The heavy-duty hydraulic cylinder with features only Parker can promise – and deliver!

Series 2H cylinders keep on performing like you expect from Parker — producing more power per pound, more power per dollar — over millions of trouble-free cycles. Everything you need for reliable 3,000 psi performance. Patented “Jewel” rod gland for longer life and lower operating costs. Chrome-plated, case hardened piston rods. Rod end studs of high yield-strength steel, with rolled threads for added strength. Tie rods with rolled threads and steel nuts. Floating cushions with float-check action and positive metal-to-metal seal. And every Parker cylinder is *individually* tested before it leaves our plant.

For additional information – call your local Parker Cylinder Distributor.

Series 2H
Heavy Duty Hydraulic Cylinders

Standard Specifications

- Heavy Duty Service – ANSI/(NFPA) T3.6.7R2 - 1996 Specifications and Mounting Dimension Standards
- Standard Construction – Square Head – Tie Rod Design
- Nominal Pressure – 3000 P.S.I.*
- Standard Fluid – Hydraulic Oil
- Standard Temperature – -10° F to +165° F**
- Bore Sizes – 1 1/2" through 6" (Larger sizes available)
- Piston Rod Diameter – 5/8" through 4"
- Mounting Styles – 18 standard styles at various application ratings
- Strokes – Available in any practical stroke length
- Cushions – Optional at either end or both ends of stroke. "Float Check" at cap end.
- Rod Ends – Three Standard Choices – Specials to Order

*If hydraulic operating pressure exceeds 3000 P.S.I., send application data for engineering evaluation and recommendation. See section C, page 84 for actual design factors.

** See section C, page 83 for higher temperature service.

In line with our policy of continuing product improvement, specifications in this catalog are subject to change.

Note: Series 2H Hydraulic Cylinders fully meet ANSI/(NFPA) T3.6.7R2 - 1996 Specifications and Mounting Dimension Standards for Square Head Industrial Fluid Power Cylinders.

Parker Cylinder

The inside story on why series 2H is your best choice in heavy duty hydraulic cylinders

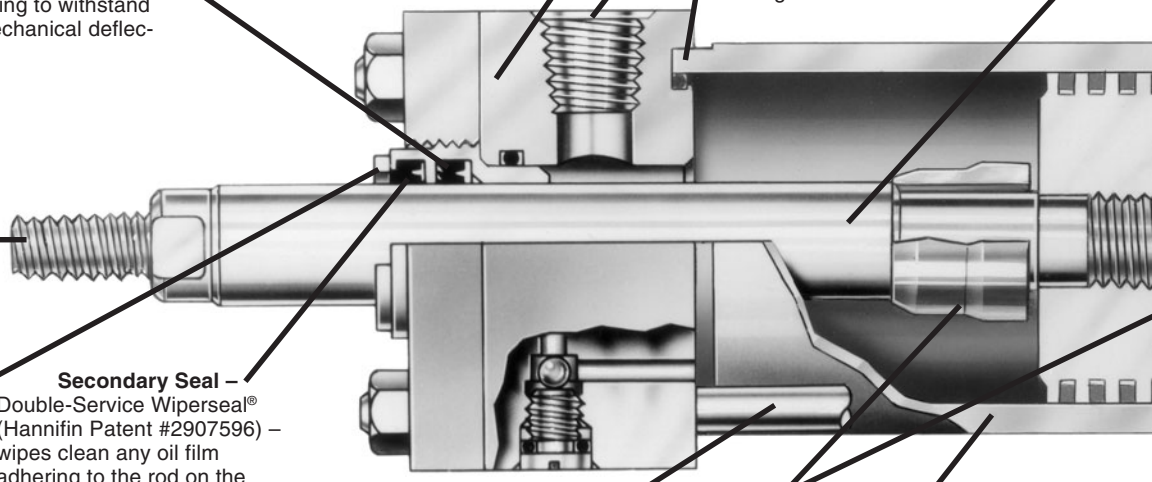
Steel Head – Bored and grooved to provide concentricity for mating parts.

Ports – S.A.E. "O" ring ports are standard.

End Seals – Pressure-actuated cylinder body-to-head and cap "O" rings.

Primary Seal – New TS-2000 Rod Seal is a proven leakproof design – completely self-compensating and self-relieving to withstand variations and conform to mechanical deflection that may occur.

Piston Rod Stud – Furnished on 2" diameter rods and smaller when standard style #4 rod end threads are required or on $1^{3}/_{8}$" diameter rods and smaller when style #8 threads are required. Also available in 2 times the catalog "A" dimension length. Studs have rolled threads and are made from high strength steel. Anaerobic adhesive is used to permanently lock the stud to the piston rod.

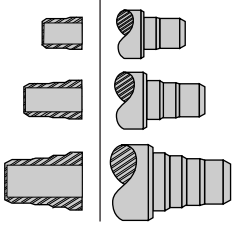


"Jewel" Rod Gland Assembly – Externally removable without cylinder disassembly. Long bearing surface is inboard of the seals, assuring positive lubrication from within the cylinder. An "O" ring is used as a seal between gland and head, and also serves as a prevailing torque-type lock.

Secondary Seal – Double-Service Wiperseal® (Hannifin Patent #2907596) – wipes clean any oil film adhering to the rod on the extend stroke and cleans the rod on the return stroke.

Stepped Cushions

Sleeve Design | Spear Design



High Strength Tie Rods – Made from 100,000 psi minimum yield steel with rolled threads for added strength.

The Cylinder Body – Heavy-wall steel tubing, honed to a micro finish bore.

Adjustable Floating Stepped Cushions – For maximum performance – economical and flexible for even the most demanding applications – provides superior performance in reducing shock. Cushions are optional and can be supplied at head end, cap end, or both ends without change in envelope or mounting dimensions.

Parker's New, Exclusive
Stepped floating cushions combine the best features of known cushion technology.

Deceleration devices or built-in "cushions" are optional and can be supplied at head end, cap end, or both ends without change in envelope or mounting dimensions. Parker cylinder cushions are a stepped design and combine the best features of known cushion technology.

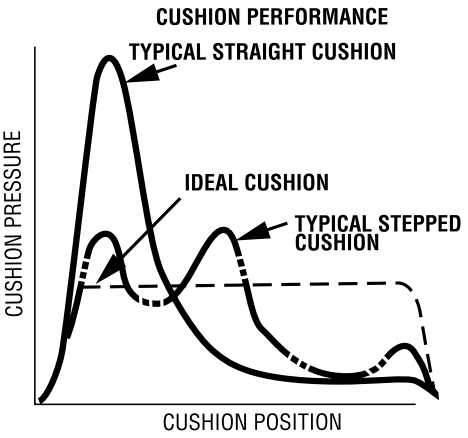
Standard straight or tapered cushions have been used in industrial cylinders over a very broad range of applications. Parker research has found that both designs have their limitations.

As a result, Parker has taken a new approach in cushioning of industrial hydraulic cylinders and for specific load and velocity conditions have been able to obtain deceleration curves that come very close to the ideal. The success lies in a stepped sleeve or spear concept where the steps are calculated to approximate theoretical orifice areas curves.

In the cushion performance chart, pressure traces show the results of typical orifice flow conditions. Tests of a three-step sleeve or spear show three pressure pulses coinciding with the steps. The deceleration cushion plunger curves shape comes very close to being theoretical, with the exception of the last $^{1}/_{2}$ inch of travel. This is a constant shape in order to have some flexibility in application. The stepped cushion design shows reduced pressure peaks for most load and speed conditions, with comparable reduction of objectionable stopping forces being transmitted to the load and the support structure.

All Parker Hannifin cushions are adjustable.

The Series 2H cylinder design incorporates the longest cushion sleeve and cushion spear that can be provided in the standard envelope without decreasing the rod bearing and piston bearing strengths.



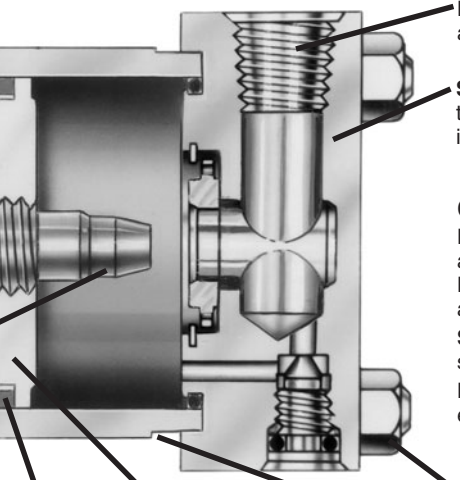
(1) When a cushion is specified at the head end:

a. A self-centering stepped sleeve is furnished on the piston rod assembly.

b. A needle valve is provided that is flush with the side of the

For additional information – call your local Parker Cylinder Distributor.

Piston Rod – Medium carbon steel, induction case-hardened to 54 Rc, hard chrome-plated and polished to 10 RMS finish. Piston rods are made from 90,000 to 100,000 psi minimum yield material in 5/8" through 4" diameters. Larger diameters vary between 57,000 and 90,000 psi minimum material, depending on rod diameter. The piston thread equals the catalog style #4 rod end thread for each rod diameter to assure proper piston-to-rod thread strength. Two wrench flats are provided for rod end attachment.



Ports – S.A.E. "O" ring ports are standard.

Steel Cap – Bored and grooved to provide concentricity for mating parts.

Optional Ports

Ports – N.P.T.F. ports are optional at no extra charge. Oversize N.P.T.F. and S.A.E. ports are available at extra charge.

Seals – Buna-N (Nitrile) seals are standard.

Fluorocarbon Seals – Optional at extra charge.

Alloy Steel Tie Rod Nuts

Align-A-Groove – (Patent #3043639) – A 3/16" wide surface machined at each end of the cylinder body. Makes precise mounting quick and easy.

One-Piece Nodular Iron Piston – The wide piston surface contacting cylinder bore reduces bearing loads. Anaerobic adhesive is used to permanently lock and seal the piston to the rod.

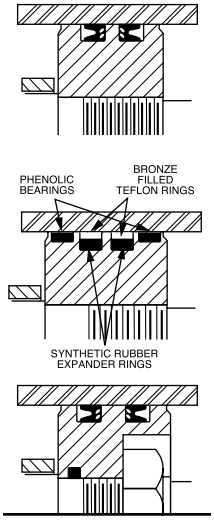
Step Cut Iron Piston Rings are standard.

The exclusive "Jewel" gland gives you longer cylinder life, better performance and lower costs.

An extra-long inboard bearing surface insures lubrication from within the cylinder. Outboard of the bearing surface are two leakproof seals – The TS-2000 and Wiperseal. The serrated TS-2000 (primary seal) is completely self-compensating and self-relieving. It adjusts to mechanical deflections or any pressure variation from near-zero to rated operating pressure. The result is positive, no-leak sealing – regardless of conditions.

The Wiperseal does double duty. On the advance stroke, it acts as a secondary pressure seal. On the return, it wipes away any dirt on the rod. This means less wear on bearing surfaces and internal parts. Longer life for working parts. And, less loss of fluid. Plus, you can replace a "Jewel" gland without removing the tie rods or the retainer. Just a few twists with a spanner wrench does the job.

Optional Pistons



Lipseal® Piston – Optional at no extra charge. Zero leakage under static conditions for hydraulic pressures up to 3000 psi. Seals are self-compensating to conform to variations in pressure, mechanical deflection, and wear. Back-up washers prevent extrusion.

Hi Load Piston – Optional at extra charge. Includes wear rings and bronze-filled PTFE seals. Two wear rings serve as bearings which deform radially under side-loading, enabling the load to be spread over a larger area and reduce unit loading. Bronze-filled PTFE seals are designed for extrusion-free, leak-proof service and longer cylinder life than the lipseal type piston.

Nut Retained Piston – Optional at extra charge.

B

head even when wide open. It may be identified by the fact that it is socket-keyed. It is located on side number 2, in all mounting styles except D, DB, DD, JJ, HH and E. In these styles it is located on side number 3.

c. On 6" bore and larger cylinders (except for 2½" bore with code 2 rod), a springless check valve is provided that is also flush with the side of the head and is mounted adjacent to the needle valve except on mounting style C, where it is mounted opposite the needle valve. It may be identified by the fact that it is slotted.

d. On 1½" - 5" bore cylinders a slotted sleeve design is used in place of the check valve.

e. 1½" - 2½" bore cylinders use a cartridge style needle valve (see Figure A).

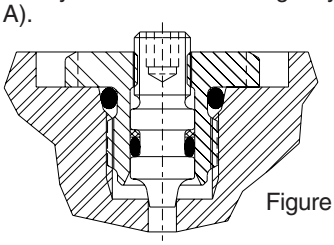


Figure A

(2) When a cushion is specified at the cap end:

a. A cushion stepped spear is provided on the piston rod.

b. A "float check" self-centering bushing is provided which incorporates a large flow check valve for fast "out-stroke" action.

c. A socket-keyed needle valve is provided that is flush with the side of the cap when wide open. It is located on side number 2 in all mounting styles except D, DB, DD, JJ, HH and E. In these styles it is located on side number 3.

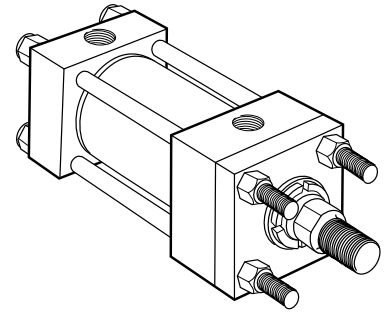
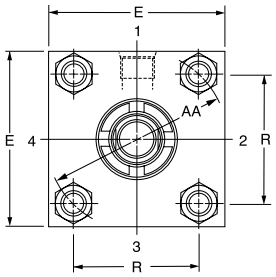
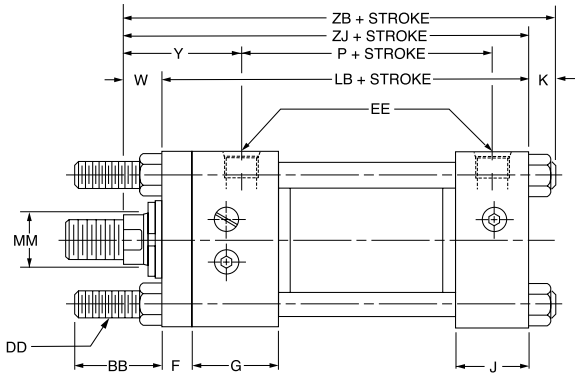
Parker Cylinder

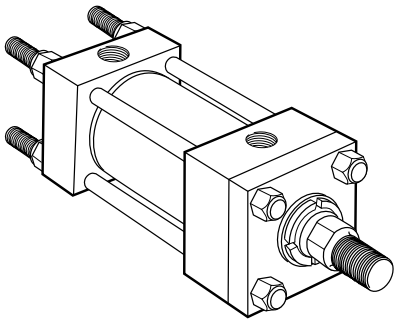
Tie Rods Extended Head End
Style TB
(NFPA Style MX3)

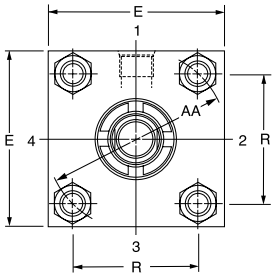


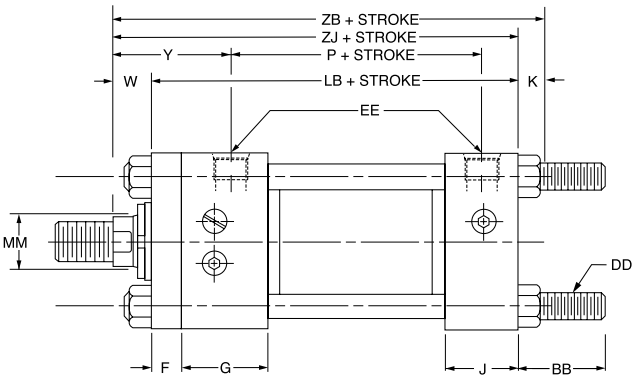




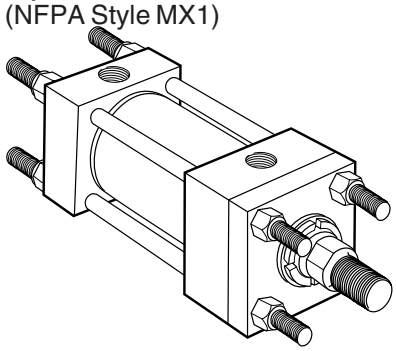
Tie Rods Extended Cap End
Style TC
(NFPA Style MX2)

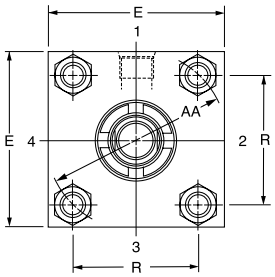


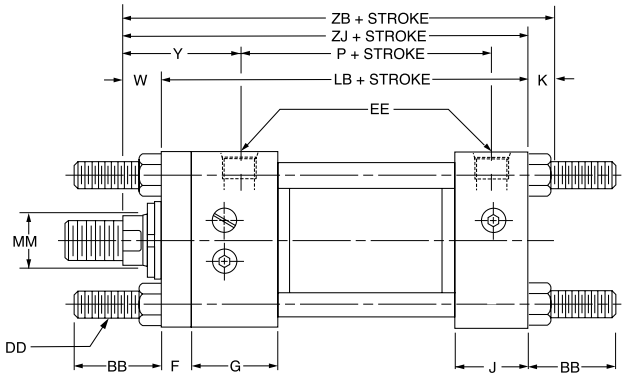




Tie Rods Extended Both Ends
Style TD
(NFPA Style MX1)



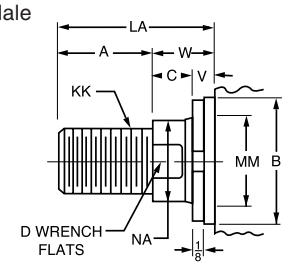




Basic Mounting (T) — NFPA MXO — Not shown is no tie rod extended and can be supplied upon request.

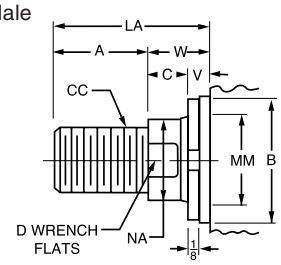
Rod End Dimensions — see table 2

Thread Style 4
(NFPA Style SM)
Small Male



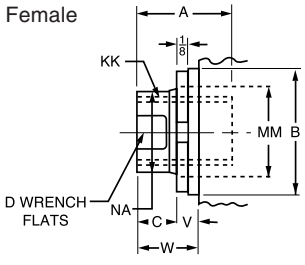
A high strength rod end stud is supplied on thread style 4 through 2" diameter rods and on thread style 8 through 1⅜" diameter rods. Larger sizes or special rod ends are cut threads. Style 4 rod ends are recommended where the workpiece is secured against the rod shoulder.

Thread Style 8
(NFPA Style IM)
Intermediate Male



When the workpiece is not shouldered, style 4 rod ends are recommended through 2" piston rod diameters and style 8 rod ends are recommended on larger diameters. Use style 9 for applications where female rod end threads are required. If rod end is not specified, style 4 will be supplied.

Thread Style 9
(NFPA Style SF)
Small Female



"Special" Thread Style 3

Special thread, extension, rod eye, blank, etc., are also available.

To order, specify "Style 3" and give desired dimensions for CC or KK, A and LA. If otherwise special, furnish dimensioned sketch.

For additional information – call your local Parker Cylinder Distributor.

Table 3 — Envelope and Mounting Dimensions

B

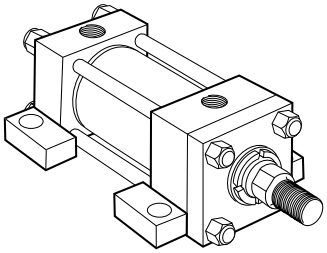
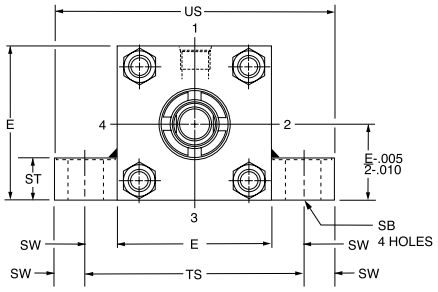
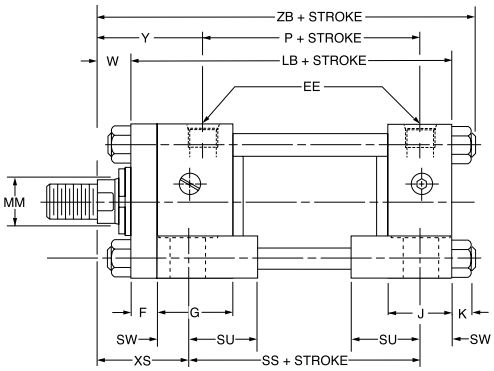
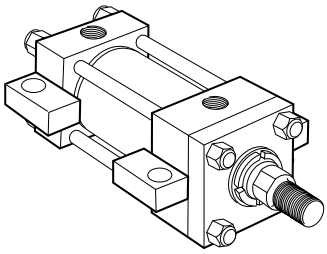
Side Lug Mountings
Style C
(NFPA Style MS2)

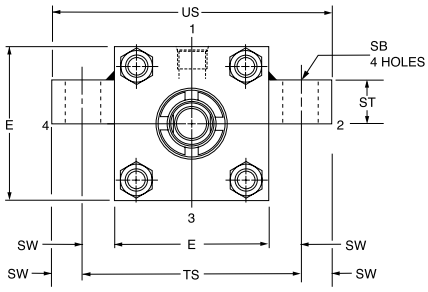


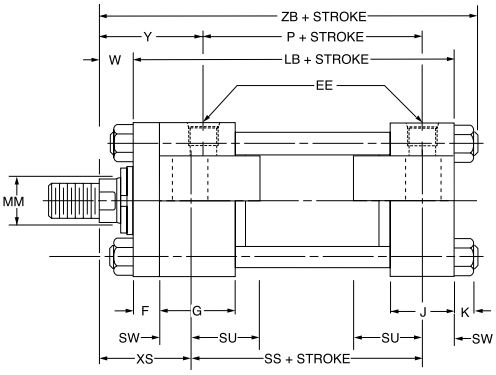




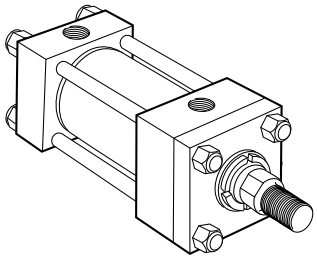
Centerline Lugs Mounting
Style E
(NFPA Style MS3)

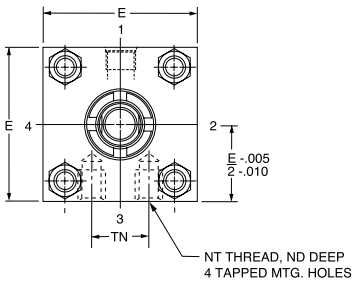


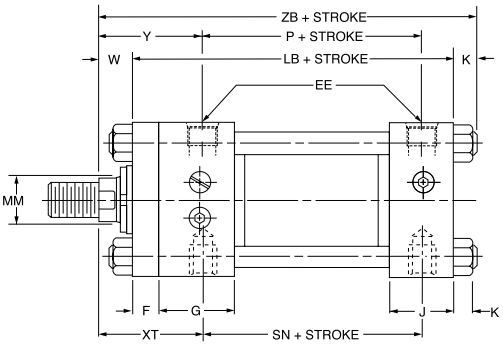




Side Tapped Mounting
Style F
(NFPA Style MS4)

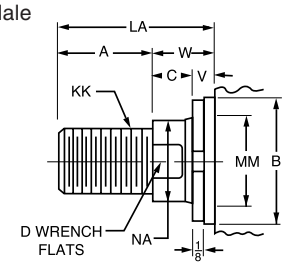






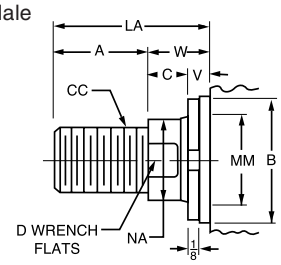
Rod End Dimensions — see table 2

Thread Style 4
(NFPA Style SM)
Small Male



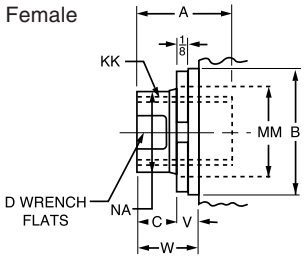
A high strength rod end stud is supplied on thread style 4 through 2" diameter rods and on thread style 8 through 1⅜" diameter rods. Larger sizes or special rod ends are cut threads. Style 4 rod ends are recommended where the workpiece is secured against the rod shoulder.

Thread Style 8
(NFPA Style IM)
Intermediate Male



When the workpiece is not shouldered, style 4 rod ends are recommended through 2" piston rod diameters and style 8 rod ends are recommended on larger diameters. Use style 9 for applications where female rod end threads are required. If rod end is not specified, style 4 will be supplied.

Thread Style 9
(NFPA Style SF)
Small Female



"Special" Thread Style 3
Special thread, extension, rod eye, blank, etc., are also available.

To order, specify "Style 3" and give desired dimensions for CC or KK, A and LA. If otherwise special, furnish dimensioned sketch.

For additional information – call your local Parker Cylinder Distributor.

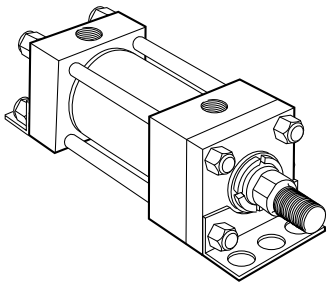
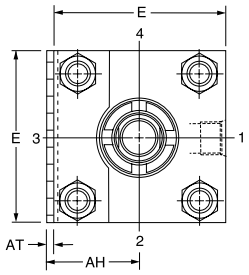
Table 3 — Envelope and Mounting Dimensions

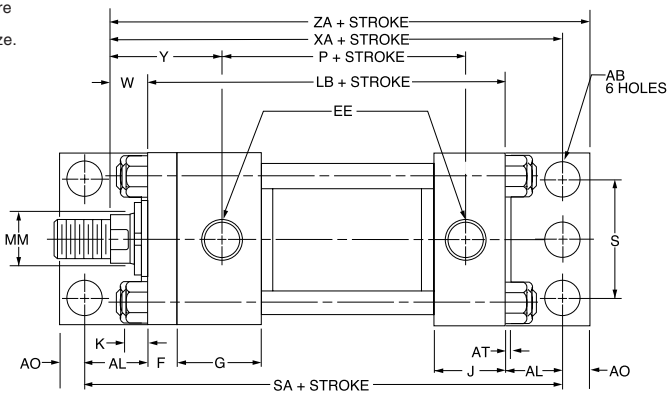
B

Side End Angles Mounting
Style CB
(NFPA Style MS1)

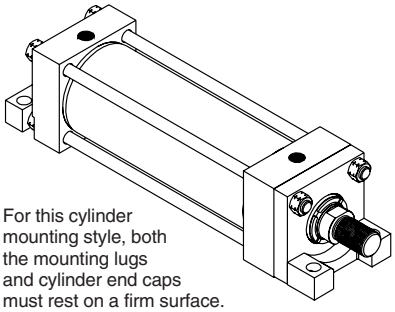
The maximum recommended operating pressure for Style CB is 500 psi. The recommended minimum stroke length is two times the bore size.



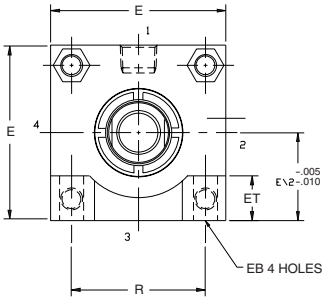


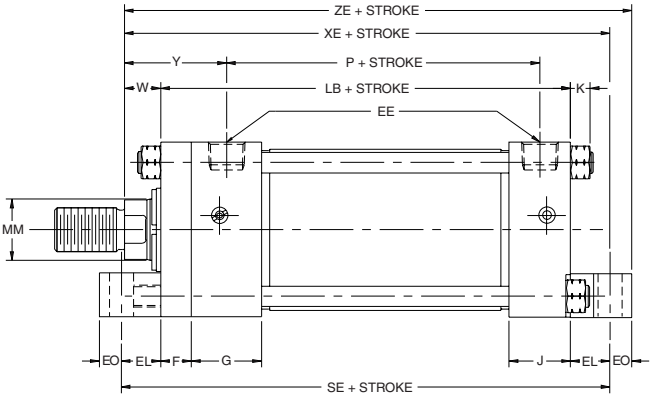


Side End Lugs Mounting
Style G
(NFPA Style MS7)



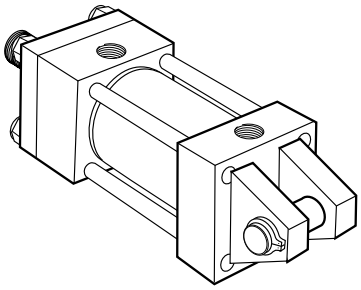
For this cylinder mounting style, both the mounting lugs and cylinder end caps must rest on a firm surface.

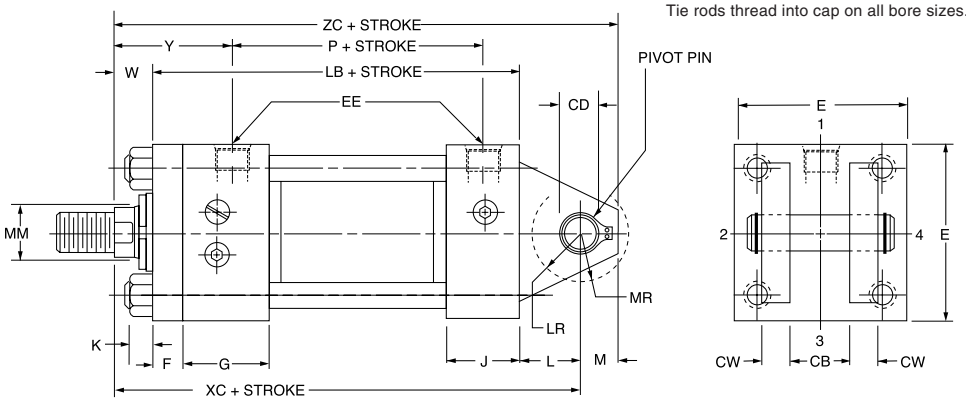




Cap Fixed Clevis Mounting
Style BB
(NFPA Style MP1)

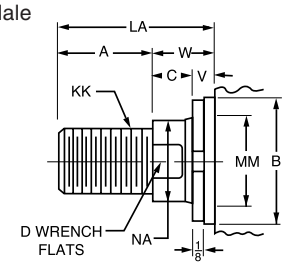
Tie rods thread into cap on all bore sizes.





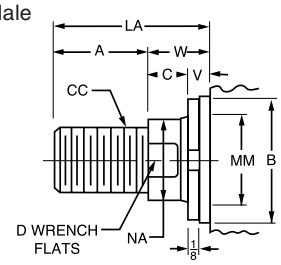
Rod End Dimensions — see table 2

Thread Style 4
(NFPA Style SM)
Small Male



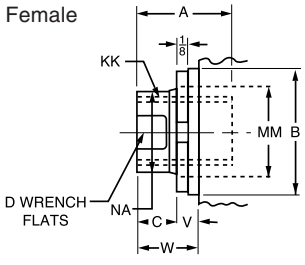
A high strength rod end stud is supplied on thread style 4 through 2" diameter rods and on thread style 8 through 1⅜" diameter rods. Larger sizes or special rod ends are cut threads. Style 4 rod ends are recommended where the workpiece is secured against the rod shoulder.

Thread Style 8
(NFPA Style IM)
Intermediate Male



When the workpiece is not shouldered, style 4 rod ends are recommended through 2" piston rod diameters and style 8 rod ends are recommended on larger diameters. Use style 9 for applications where female rod end threads are required. If rod end is not specified, style 4 will be supplied.

Thread Style 9
(NFPA Style SF)
Small Female



"Special" Thread Style 3

Special thread, extension, rod eye, blank, etc., are also available.

To order, specify "Style 3" and give desired dimensions for CC or KK, A and LA. If otherwise special, furnish dimensioned sketch.

For additional information – call your local Parker Cylinder Distributor.
